Canter 2012 Service Manual

https://truckmanualshub.com/

FE.FG

SERVICE MANUAL
2012 Model
FOREWORD

This Service Manual contains maintenance and repair methods for the Mitsubishi Fuso Truck FE. FG Series. Read this manual carefully as an aid in providing correct, efficient maintenance. Please note that the information and specifications contained within this manual may change without notice. This is due to product modifications and continued vehicle improvements that are made throughout the model years. Should you encounter any discrepancy in the information provided, please do not hesitate to contact your nearest Mitsubishi Fuso Dealer or Mitsubishi Fuso Truck of America, Inc.

HOW TO READ THIS MANUAL

This manual consists of the following parts:
- Specifications
- Structure and Operation
- Troubleshooting
- Circuits
- Electrical Equipment Installation Positions
- Inspection of Electrical Equipment
- On-vehicle Inspection and Adjustment
- Connector configuration chart

On-vehicle Inspection and Adjustment
- Procedures for inspection and adjustment of individual parts and assemblies as mounted on the vehicle are described including specific items to check and adjust. Specified or otherwise, inspection should be performed for looseness, play, backlash, crack, damage, etc.

Service procedures
- Procedures for servicing components and parts off the vehicle are described centering on key points in their removal, installation, disassembly, reassembly, inspection, etc.

Inspection
- Check items subject to “acceptable/unacceptable” judgement on the basis of service standards are all given.
- Some routine visual checks and cleaning of some reused parts are not described but must always be included in actual service work.

Caution
- This service manual contains important cautionary instructions and supplementary information under the following four headings which identify the nature of the instructions and information:

DANGER ⚠	Precautions that should be taken in handling potentially dangerous substances such as battery fluid and coolant additives.
WARNING ⚠	Precautionary instructions, which, if not observed, could result in serious injury or death.
CAUTION ⚠	Precautionary instructions, which, if not observed, could result in damage to or destruction of equipment or parts.
NOTE	Suggestions or supplementary information for more efficient use of equipment or better understanding.

Terms and Units
- Front and rear
  The forward running direction of the vehicle is referred to as the front and the reverse running direction is referred to as the rear.

- Left and right
  Left hand side and right hand side, when facing the forward running direction of the vehicle, are respectively left and right.

Standard value
- Standard value dimensions in designs indicating: the design dimensions of individual parts, the standard clearance between two parts when assembled, and the standard value for an assembly part, as the case may be.

https://truckmanualshub.com/

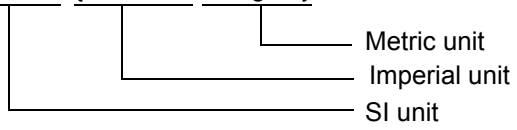
Limit
- When the value of a part exceeds this, it is no longer serviceable in respect of performance and strength and must be replaced or repaired.

Tightening torque
- Values are directly specified for out-of-standard tightening torques for bolts and nuts.
- Where there is no specified figure for tightening torque, follow the table covering standard tightening torques. (Values for standard tightening torques are based on thread size and material.)
- When the item is to be tightened in a wet state, “wet” is indicated. Where there is no indication, read it as dry.

Units
- Tightening torques and other parameters are given in SI* units with imperial unit and metric units added in brackets { }.

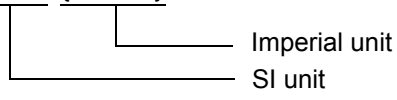
***SI: Le Système International d’Unités**

Example: 390 N·m {290 ft.lbs, 40 kgf·m}



Unit		SI unit {imperial unit, metric unit}	Conversion factor
Force		N {lbs, kgf}	9.80665 N {2.2046 lbs, 1 kgf}
Moment of force		N·m {ft.lbs, kgf·m}	9.80665 N·m {7.2329 ft.lbs, 1 kgf·m}
Pressure	Positive pressure	kPa {psi, kgf/cm^2}	98.0665 kPa {14.22 psi, 1 kgf/cm^2}
	Vacuum pressure	kPa {in.Hg, mmHg}	0.133322 kPa {0.03937 in.Hg, 1 mmHg}
Volume		J {BTU, kcal}	4186.05 J {3.96825BTU, 1 kcal}
Heat quantity		W {BTU/h, kcal/h}	1.16279W {3.96825BTU/h, 1 kcal/h}

Example: 30 mm {1.18 in.}



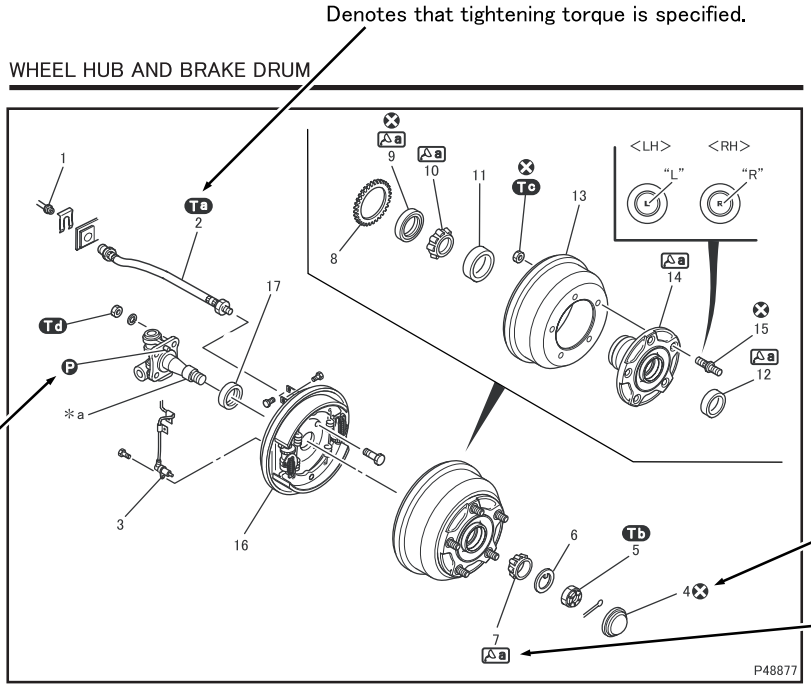
Unit	SI unit {imperial unit}	Conversion factor
Length	mm {in.}	1 mm {0.03937 in.}
	m {ft.}	1 m {3.2808 ft.}
	km {mile}	1 km {0.6214 mile}
Mass	kg {lb}	1 kg {2.2046 lb}
	g {oz}	1 g {0.035274 oz}
Temperature (in degree Celsius)	°C {°F}	1°C {(1°C × 1.8 + 32)°F}
Velocity	km/h {mph}	1 km/h {0.6214 mph}
	m/s {ft/s}	1 m/s {3.281 ft/s}
Volume	L {qts}, L {gal}	1 L {1.05336 qts}, 1 L {0.2642 gal}
	cm^3 {cu.in.}	1 cm^3 {0.061023 cu.in.}
Area	m^2 {in^2}, m^2 {ft^2}	1 m^2 {1.550 × 10^3 in^2}, 1 m^2 {1.076 × 10 ft^2}

https://truckmanualshub.com/

HOW TO READ THIS MANUAL

Illustrated Parts Breakdown and Service Procedures

Symbol	Denotation	Application	Remarks
Ta	Tightening torque	Parts not tightened to standard torques (standard torques specified where necessary for servicing)	Specified values shown in table See Table of Standard Tightening Torques for parts for which no tightening torques are specified.
P	Locating pin	Parts to be positioned for installation	
⊗	Non-reusable parts	Parts not to be reused	
a	Lubricant and/or sealant	Parts to be coated with lubricant or sealant for assembly or installation	Necessary lubricant and/or sealant, quantity required, etc. are specified in table.
a	Special tool	Parts for which special tools are required for service operation	Tool name/shape and part number are shown in table.
*a	Associated part	Parts associated with those removed/disassembled for servicing	



● Disassembly sequence

1 Brake pipe
2 Brake hose
3 Wheel speed sensor
4 Hub cap
5 Lock nut
6 Lock washer
7 Outer bearing inner race
8 Anti-lock brake system rotor
9 Oil seal
10 Inner bearing inner race
11 Inner bearing outer race
12 Outer bearing outer race
13 Brake drum
14 Wheel hub
15 Hub bolt
16 Front drum brake (See Gr.35A)
17 Spacer

*a : Knuckle
P : Locating pin
⊗ : Non-reusable parts

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (unit : mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
7, 10, 11, 12	Starting torque of wheel hub bearing (Tangential force at hub bolt position with oil seal fitted in)		1 to 3.5 N·m {0.7 to 2.6 ft.lbs, 0.10 to 0.35 kgf·m} (Tangential force:8.8 to 28.4 N {2.0 to 6.4 lbs, 0.9 to 2.9 kgf})	–	Adjust or replace
14	Brake drum	Inside diameter	320 {12.6}	322 {12.7}	Repair or replace
		Cylindricality	0.05 {0.0020}	0.05 {0.0079}	

These location numbers correspond with disassembly sequence numbers.

P58289N

https://truckmanualshub.com/

"Wet" is indicated when part is to be tightened with oil or grease applied to its threads.

Tightening torque (unit: N·m{ft.lbs, kgf·m})

Mark	Part to be tightened	Tightening torque	Remarks
Ta	Brake force tightening	13 to 17{9.6 to 13, 1.3 to 1.7}	–
Tb	Lock nut	113 ± 15{83 ± 11, 11.5 ± 1.5}	Wet
Tc	Nut (brake drum and wheel hub mounting)	343 ± 39{250 ± 29, 35 ± 4}	–
Td	Nut (front drum brake mounting)	118 ± 20{87 ± 15, 12 ± 2}	–

Lubricant and/or sealant

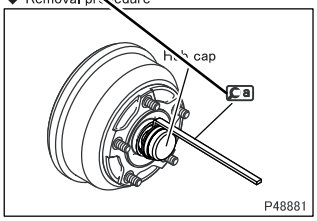
Mark	Point of application	Specified lubricant and/or sealant	Quantity
Aa	Between rolls of outer bearing inner race and inner bearing inner race	Mitsubishi wheel bearing grease	As required
	Inside wheel hub		395 ± 40 g {13.9 ± 1.41 oz}

Special tools (unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
Ca	Hub Cap Wrench A: 0.5°, B: 78°  P49261	MB999108	Removal of hub cap
Cb	Oil Seal Installer A: ϕ84 {3.31}, B: ϕ70 {2.76}  05619	MB999097	Installation of oil seal

Identification marks for special tools are the same as used in the text.

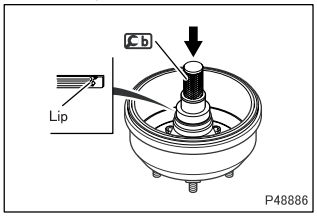
◆ Removal procedure



P48881

■Removal: Hub cap

◆Installation procedure◆



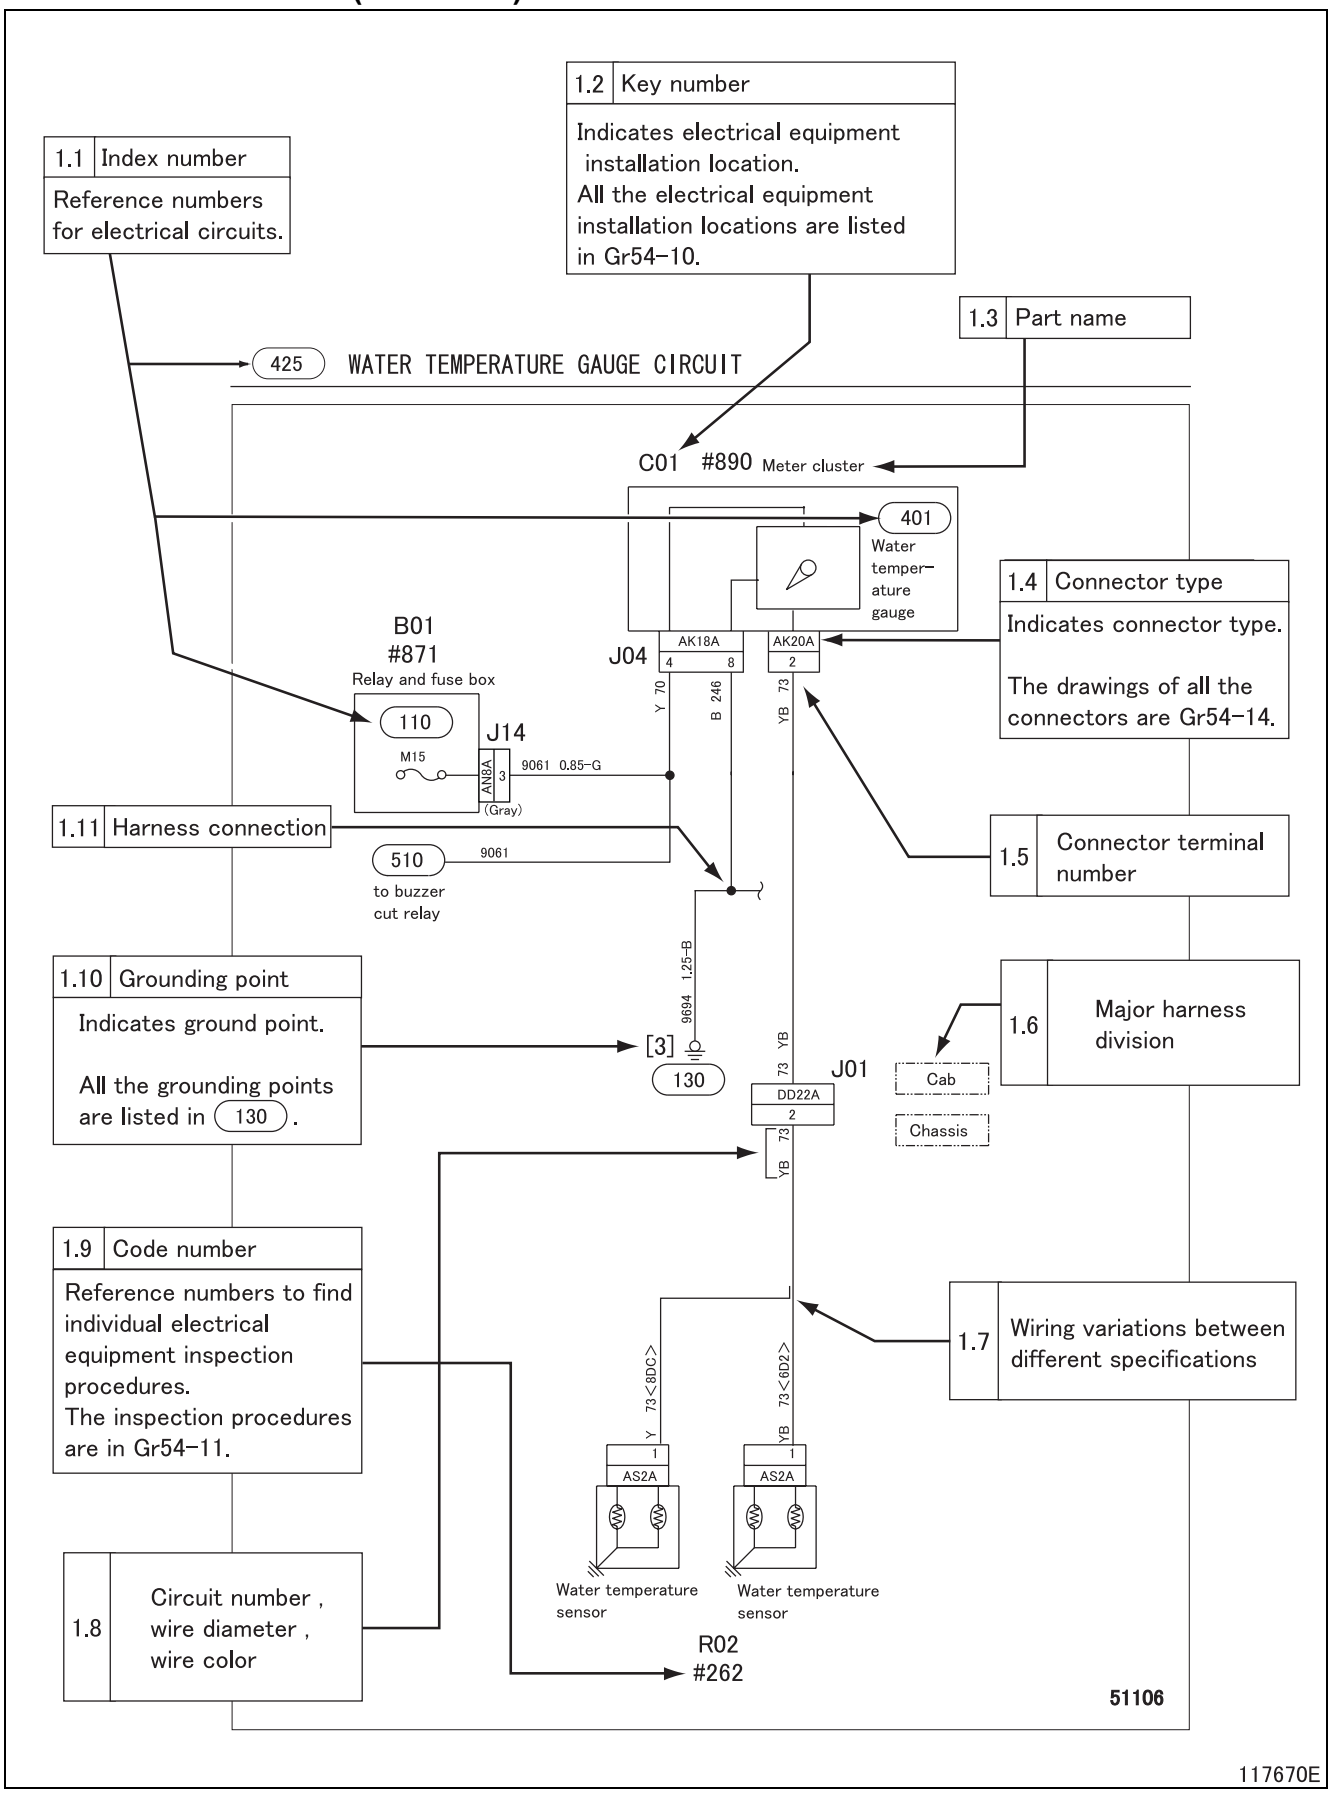
P48886

■Installation: Oil seal
Apply grease to the lip of the oil seal, then fit the oil seal onto the wheel huh in the illustrated direction.

P58290N

https://truckmanualshub.com/

How to Read Circuits (Electrical)



https://truckmanualshub.com/

1.1 Index number: (100) to (999)

- Index numbers are used as reference numbers for electrical circuits. Each electrical circuit has been assigned its own index number.

1.2 Key number: A01 to Z99

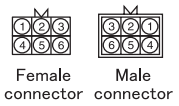
- Key numbers indicate electrical equipment installation locations. The installation location of an electrical equipment can be easily found using its key number shown in a circuit diagram.
  All of the electrical equipment installation locations are listed in Gr54-10.

1.3 Part name

1.4 Connector type (type indication)

- A list of the connectors used is included in Gr54-14.

1.5 Connector terminal number



Connector terminal numbering starts with the upper left corner for female connectors and with the upper right corner for male connectors.

P50678E

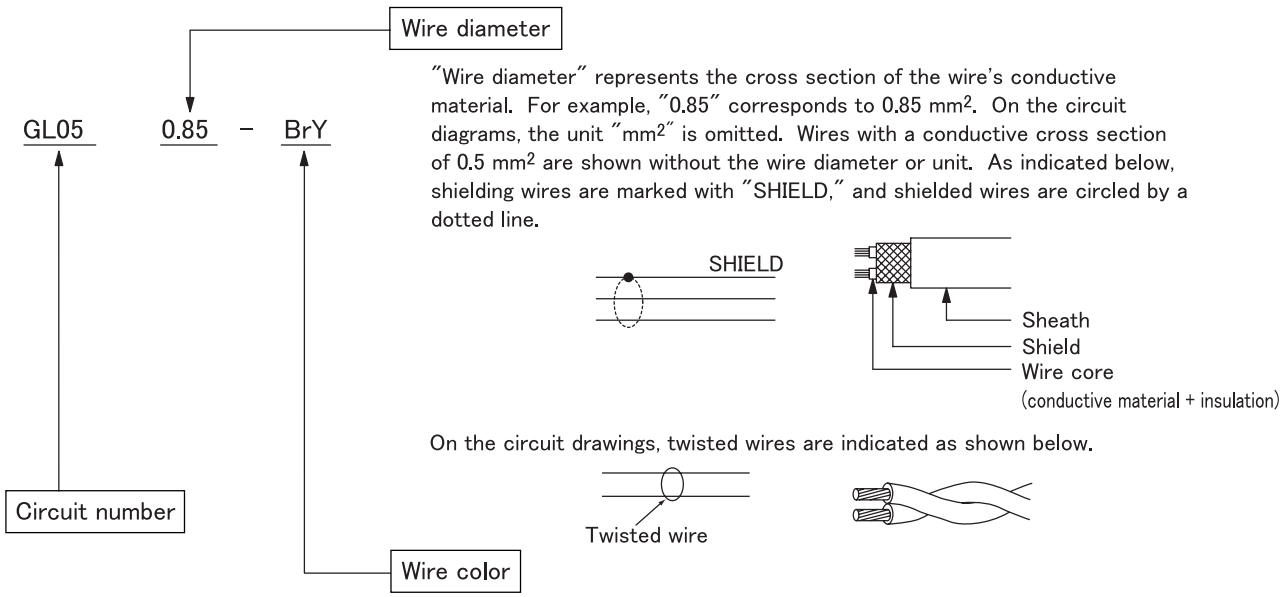
1.6 Major harness division

- Major harness divisions are shown.

1.7 Wiring variations between different specifications

- Variations in wiring/circuit between different vehicle specifications are clearly indicated as shown.

1.8 Circuit number, wire diameter, wire color



"Wire diameter" represents the cross section of the wire's conductive material. For example, "0.85" corresponds to 0.85 mm². On the circuit diagrams, the unit "mm²" is omitted. Wires with a conductive cross section of 0.5 mm² are shown without the wire diameter or unit. As indicated below, shielding wires are marked with "SHIELD," and shielded wires are circled by a dotted line.

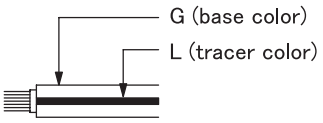
On the circuit drawings, twisted wires are indicated as shown below.

Wire colors are represented by the first letter of the color.
Colors that all start with the letter "B" are indicated as follows.

- BLACK → B
- BLUE → L
- BROWN → Br

Wires that have both base and tracer colors are indicated by two letters.

RY (Yellow tracer on Red base)
GL (Blue tracer on Green base)



P50680E

1.9 Code number: #001 to #999

- Code numbers are reference numbers to find individual electrical equipment inspection procedures. The inspection procedure for an electrical equipment can be found using its code number shown in a circuit diagram.

https://truckmanualshub.com/

1.10 Grounding point: [1] to [99]

- Locations where wires are grounded to the vehicle. All of the grounding points are listed in (130).

1.11 Harness connection

- The arrow in the wiring diagram indicates where harnesses are connected, and NOT the flow of electricity.

Wire color

Wire color		Base color + tracer									
B	Black	BW	Black/ white	BY	Black/ yellow	BR	Black/red	BG	Black/ green	BL	Black/ blue		
Br	Brown	BrW	Brown/ white	BrB	Brown/ black	BrY	Brown/ yellow	BrR	Brown/ red	BrG	Brown/ green		
G	Green	GW	Green/ white	GR	Green/ red	GY	Green/ yellow	GB	Green/ black	GL	Green/ blue	GO	Green/ orange
Gr, Gy	Gray	GrL, GyL	Gray/ blue	GrR, GyR	Gray/ red								
L	Blue	LW	Blue/ white	LR	Blue/red	LY	Blue/ yellow	LB	Blue/ black	LO	Blue/ orange	LG	Blue/ green
Lg	Light green	LgR	Light green/ red	LgY	Light green/ yellow	LgB	Light green/ black	LgW	Light green/ white				
O	Orange	OL	Orange/ blue	OB	Orange/ black	OG	Orange/ green						
P	Pink	PB	Pink/ black	PG	Pink/ green	PL	Pink/ blue	PW	Pink/ white				
Pu	Purple												
R	Red	RW	Red/ white	RB	Red/ black	RY	Red/ yellow	RG	Red/ green	RL	Red/blue	RO	Red/ orange
Sb	Sky blue												
V	Violet	VY	Violet/ yellow	VW	Violet/ white	VR	Violet/red	VG	Violet/ green				
W	White	WR	White/ red	WB	White/ black	WL	White/ blue	WG	White/ green	WO	White/ orange		
Y	Yellow	YR	Yellow/ red	YB	Yellow/ black	YG	Yellow/ green	YL	Yellow/ blue	YW	Yellow/ white	YO	Yellow/ orange
		YP	Yellow/ pink	YV	Yellow/ violet								

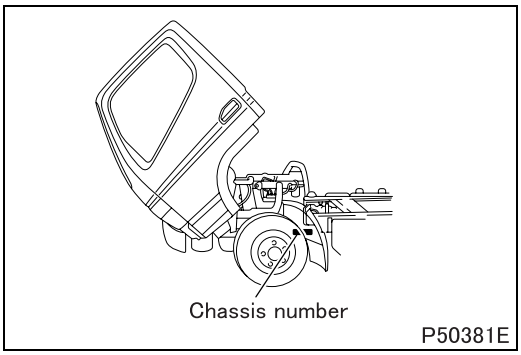
https://truckmanualshub.com/

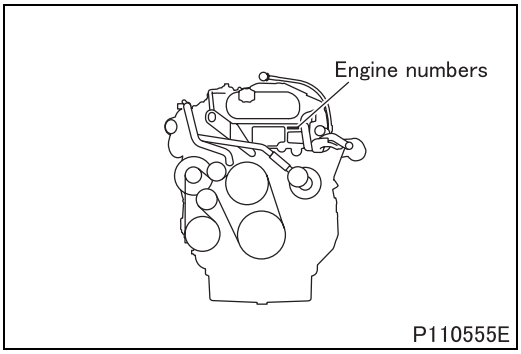
M E M O

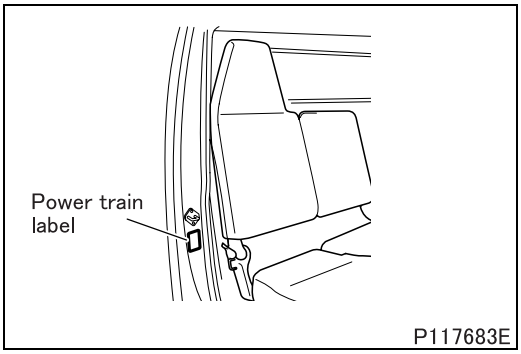
https://truckmanualshub.com/

CHASSIS NUMBER, ENGINE NUMBER, POWER TRAIN LABEL

- Chassis and engine numbers are assigned to each vehicle and engine respectively in the order of production. These numbers are required at vehicle inspection for registration.

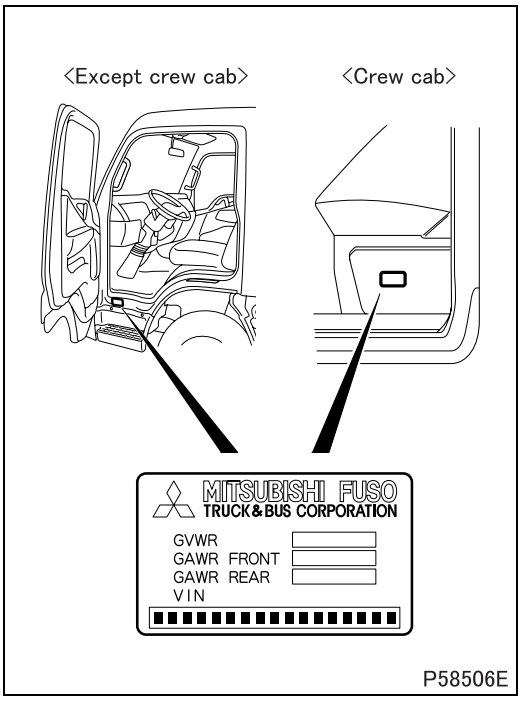






- Power train label located in the position illustrated indicates the vehicle model, chassis number and information relevant to the vehicle's power train components.

https://truckmanualshub.com/



- The vehicle identification number is punch-marked on the plate, which is attached in the position as illustrated.
  The vehicle identification number consists of a 17-digit set of alphanumeric characters. Each digit represents the following specifications.

J	L	6	A	R	G	1	A	■	C	K	■■■■■■
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)

(1)	Country	J:	Japan
(2), (3)	Vehicle type	L, 6:	Incomplete vehicle
(4)	Gross vehicle weight / Brake system		
		A:	10,001 to 14,000 lbs. / Hydraulic
		B:	14,001 to 16,000 lbs. / Hydraulic
		C:	16,001 to 19,500 lbs. / Hydraulic
(5)	Line	M:	FEC52S
		N:	FEC72S
		P:	FEC72W
		R:	FEC92S
		S:	FGB72S
(6)	Series (wheel base)	D:	2.6 to 2.89 m (8.53 to 9.48 ft.)
		E:	3.2 to 3.49 m (10.49 to 11.44 ft.)
		G:	3.8 to 4.09 m (12.46 to 13.41 ft.)
		H:	4.1 to 4.39 m (13.45 to 14.40 ft.)
		K:	4.7 to 4.99 m (15.41 to 16.37 ft.)
(7)	Cab/chassis type and make		
		1:	Chassis cab for Mitsubishi Fuso
(8)	Engine	A:	2.998 L Diesel turbo charged and charge air cooled
(9)	Check digit		
(10)	Model year	A:	2012
(11)	Plant	K:	Kawasaki
(12)	Plant sequential number		

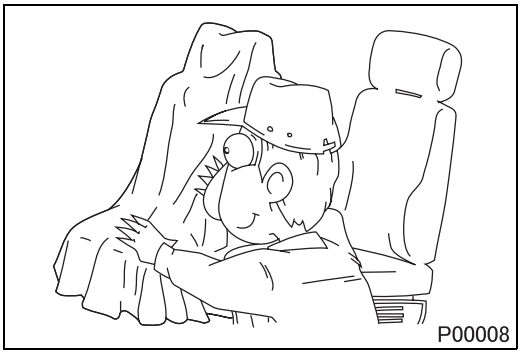
https://truckmanualshub.com/

PRECAUTIONS FOR MAINTENANCE OPERATION

DANGER ⚠

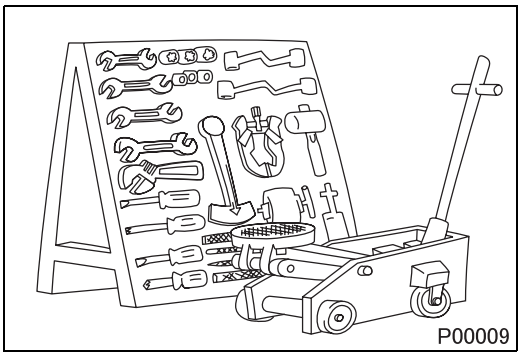
- **This product contains or emits chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.**

- Before performing service operations, inquire into the customer's complaints and ascertain the condition by checking the total distance traveled, the conditions under which the vehicle is operated, and other relevant factors on the vehicle. And note the necessary information. This information will help you to service the vehicle efficiently.
  - Check the location of the fault, and identify its cause. Based on your findings, determine whether parts must be removed or disassembled. Then, follow the service procedure given in this manual.



P00008

- Perform service operations on a level surface. Before starting, take the following preparatory steps:
  - To prevent soiling and damage, place covers over the seats, trim and floor in the cab and over the paintwork of the body.

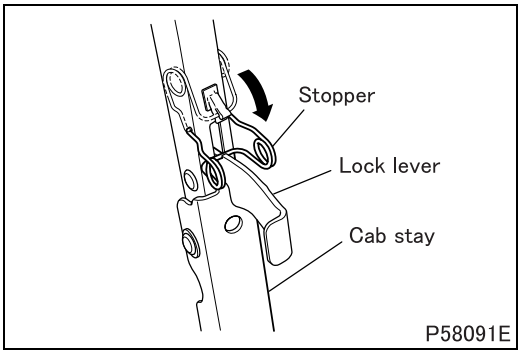


P00009

- Prepare all the general and special tools necessary for the job.

WARNING ⚠

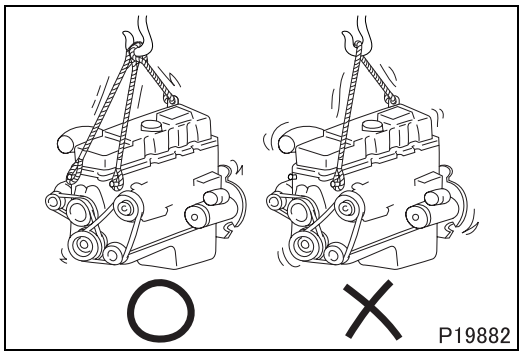
- **Special tools must be used wherever specified in this manual. Do not attempt to use other tools since they could cause injuries and/or vehicle damage.**



P58091E

- After manually tilting the cab, be sure to engage the stopper with the lock lever to secure the cab stay in a rigid state.

https://truckmanualshub.com/

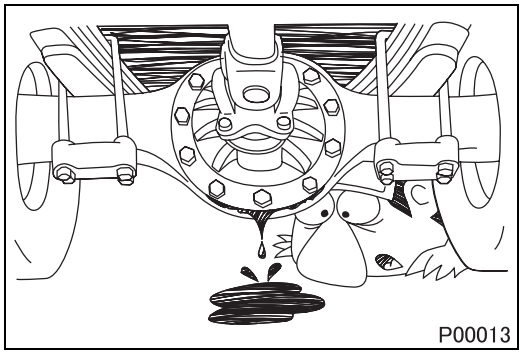


- Take extreme care when removing/installing heavy items such as engine, transmission and axle. When lifting heavy items using a cable etc., observe the following precautions.
  - Identify the weight of the item being lifted. Use the cable that is strong enough to support the weight.

  - If lifting eyes are not provided on the item being lifted, tie a cable around the item taking into account the item's center of gravity.

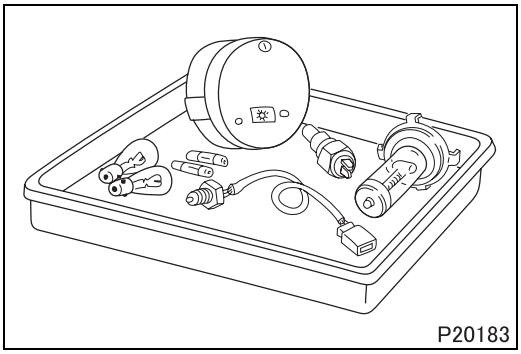
  - Do not allow anyone to pass or stay under a lifted item which may possibly fall.

- Never work in shoes that have oily soles.
  When working with a partner or in a group, use pre-arranged signals and pay constant attention to safety. Be careful not to touch switches and levers unintentionally.



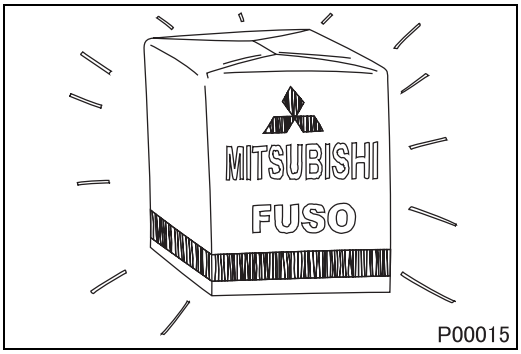
- Inspect for oil leakage etc. before washing the vehicle. If the order is reversed, any oil leakage or fault that may exist could go unnoticed during inspection.

https://truckmanualshub.com/



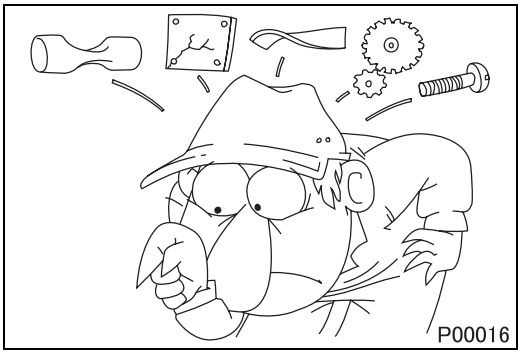
P20183

- Prepare replacement parts ready for installation.



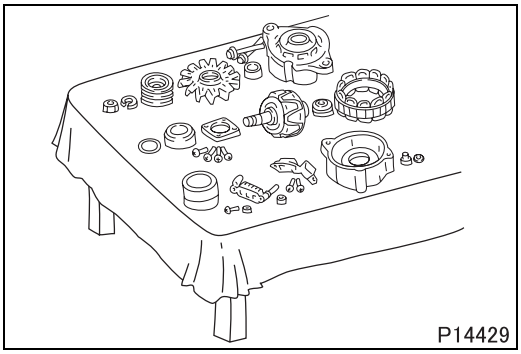
P00015

- Oil seals, packings, O-rings and other rubber parts, gaskets, and split pins must be replaced with new ones after removal. Use only genuine MITSUBISHI replacement parts.



P00016

- When disassembling parts, visually check them for wear, cracks, damage, deformation, deterioration, rust, corrosion, defective rotation, fatigue, clogging and any other possible defect.

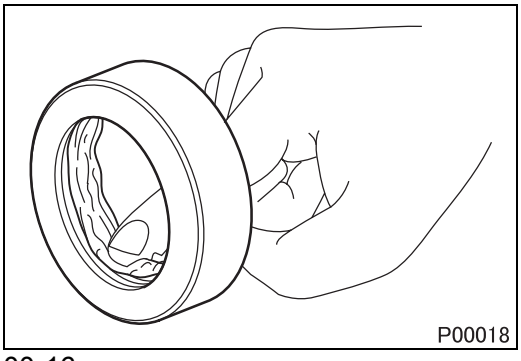


P14429

- To facilitate correct reassembly of parts, make alignment marks on them before disassembly and arrange disassembled parts neatly. Make punch marks and other alignment marks where they will not detract from parts' functionality and appearance.
- After removing parts from the vehicle, cover the area to keep it free of dust.

CAUTION ⚠

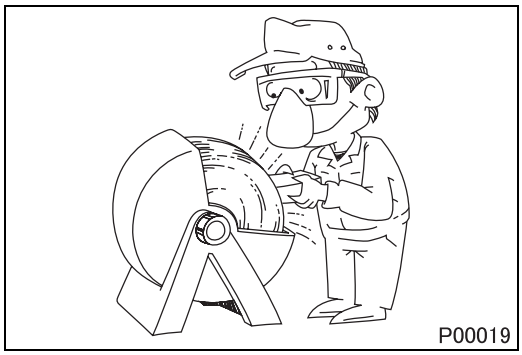
- **Be careful not to mix up identical parts, similar parts and parts that have left/right alignments.**
- **Keep new replacement parts and original (removed) parts separately.**



P00018

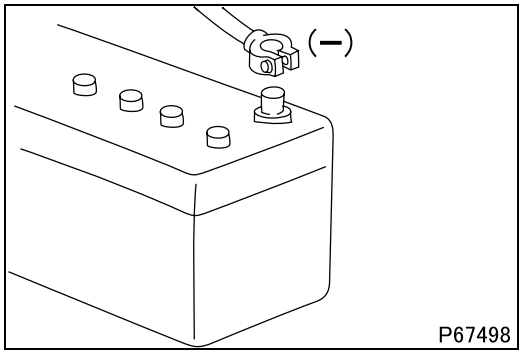
- Apply the specified oil or grease to U-seals, oil seals, dust seals and bearings before reassembly.
- Always use the specified oils and greases when performing inspection or replacement. Immediately wipe away any excess oil or grease with a rag.

https://truckmanualshub.com/



P00019

- Wear safety goggles when using a grinder or welder. Wear gloves when necessary, and watch out for sharp edges and other items that might wound your hands.



P67498

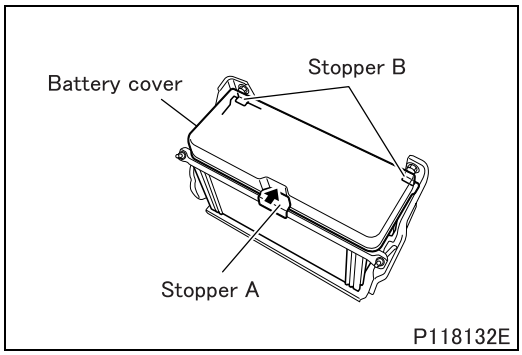
- Before working on the electrical system, disconnect the (–) battery cable to prevent short circuits.

CAUTION ⚠

- **Make sure that the starter switch and lighting switches are OFF before disconnecting or connecting battery cable. (Semiconductor components may otherwise be damaged.)**
- **Be sure to place the starter switch into the LOCK or OFF position and wait for about 2 minutes before disconnecting battery cables, harnesses or connectors. (This is because the BlueTec® system is still in operation.)**
- **Disconnect the (–) battery cable, then insulate the (–) terminal of the battery and (–) battery cable with insulating tape or the like.**
- **If the (–) battery cable is not disconnected, battery voltage will remain constantly applied to the B terminal, inviting danger of electric shock.**

CAUTION ⚠

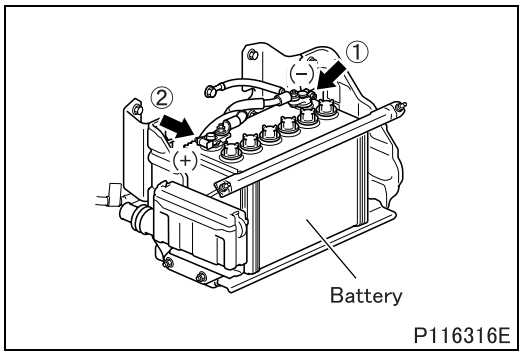
- **Make sure that the starter switch and lighting switches are OFF before disconnecting or connecting battery cable. (Semiconductor components may otherwise be damaged.)**
- **The BlueTec® system remains in operation for about 2 minutes after the starter switch is set to the LOCK position. Before disconnecting battery cables, harnesses or connectors, be sure to wait for at least 2 minutes after turning the starter switch to the LOCK or OFF position.**
- **Connect the (+) and (–) battery cables correctly. If the polarity of the battery connections was reverse, the power switch and SAM would be damaged, leading to a vehicle fire.**



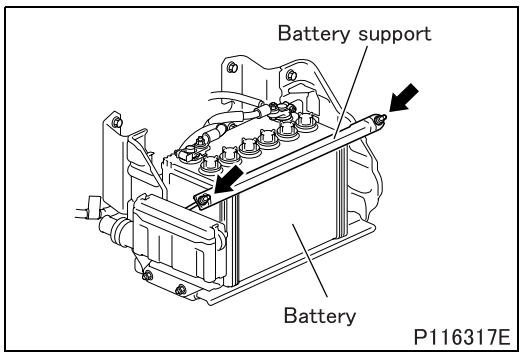
P118132E

- Removal and installation of the battery cover
  - Press the stopper A at the arrow to release the battery cover from the stopper A.
  - Draw the battery cover toward you to detach it from the stoppers B.
  - To install the battery cover, follow the removal sequence in reverse. After installing, make sure that the battery cover is securely attached.

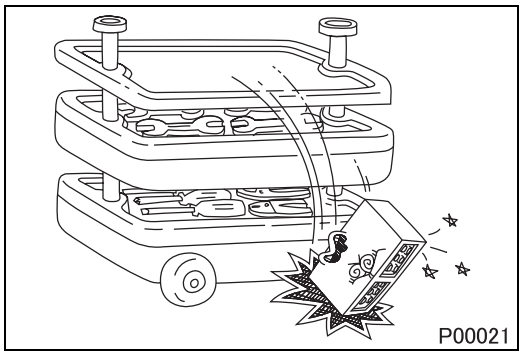
https://truckmanualshub.com/



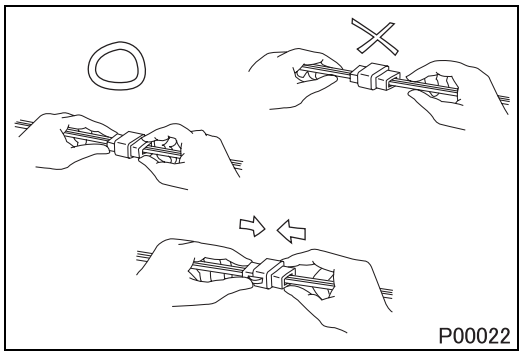
- Removal and installation of battery
  - Disconnect the battery cables at the battery terminals in the following sequence.
  - Disconnect the battery cable at the (–) terminal (1).
  - Disconnect the battery cable at the (+) terminal (2).
  - To connect battery cable, follow the disconnection sequence in reverse. Press in the terminal of the battery cable all the way to the bottom of the battery terminal post and tighten the nut to secure the cable.
    Tightening torque: 5 to 7 N·m {3.7 to 5.2 ft.lbs, 0.5 to 0.7 kgf·m}



- Remove the nuts holding the battery, then remove the battery support.
- Remove the battery.
- To install the battery, follow the removal sequence in reverse. After installing, make sure that the battery is securely held in place.

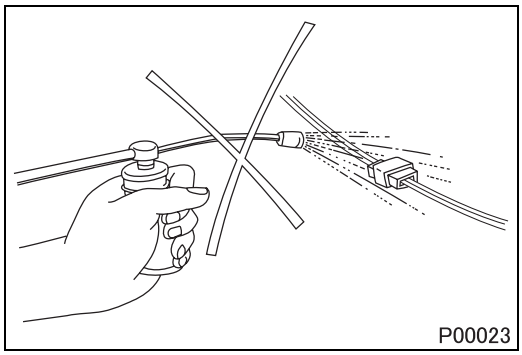


- Carefully handle sensors relays, and other items that are sensitive to shock and heat. Do not remove or paint the cover of any control unit.

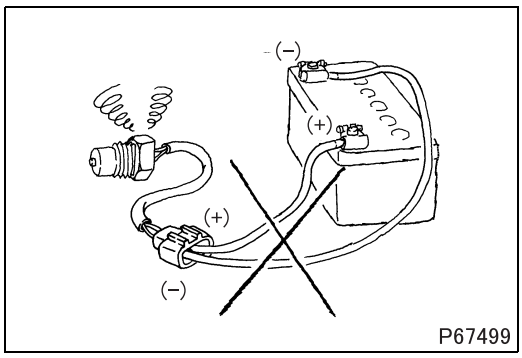


- When separating connectors, grasp the connectors themselves rather than the harnesses.
- To separate locking connectors, first push them in the direction of the arrows. To reconnect locking connectors, push them together until they click.

https://truckmanualshub.com/

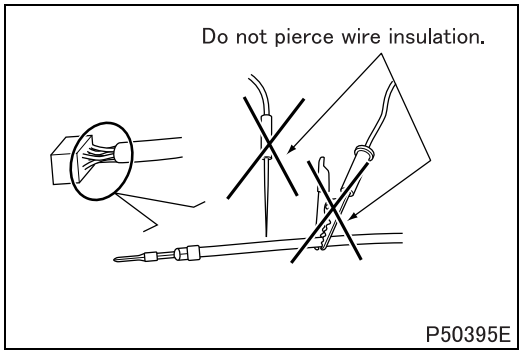


- Before washing the vehicle, cover electrical parts to keep them dry. (Use plastic sheets or equivalent.) Keep water away from harness connectors and sensors and immediately wipe off any water that gets on them.



- When applying a voltage to a part for inspection purposes, check that the (+) and (–) cables are connected properly then gradually increase the voltage from zero. Do not exceed the specified voltage.
  Remember that control units and sensors do not necessarily operate on the battery voltage.

1. Handling Precautions for Electric Circuits



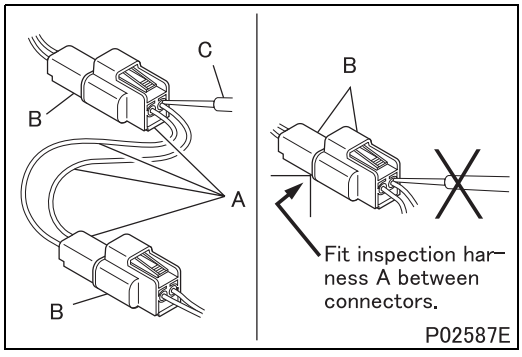
CAUTION ⚠

- **Do not pierce wire insulation with test probes or alligator clips when performing electrical inspections. Doing so can, particularly with the chassis harness, hasten corrosion.**

1.1 Inspection of harnesses

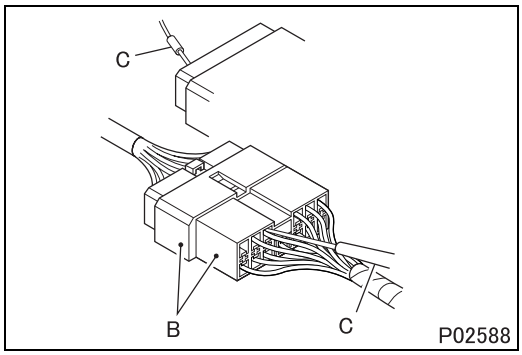
(1) Inspections with connectors fitted together

(1.1) Waterproof connectors



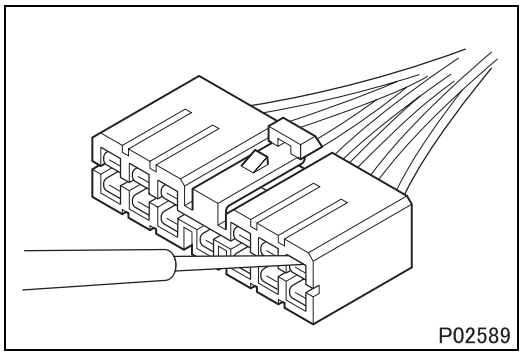
- Connect an inspection harness and connector A between the connectors B of the circuit to be inspected. Perform the inspection by applying a test probe C to the connectors of the inspection harness. Do not insert the test probe C into the wire-entry sides of the waterproof connectors since this would damage their waterproof seals and lead to rust.

https://truckmanualshub.com/



(1.2) Non-waterproof connectors

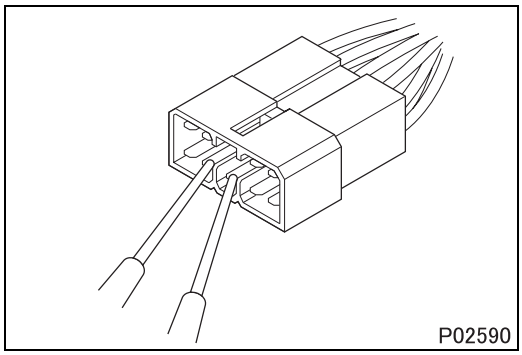
- Perform the inspection by inserting a test probe C into the wire-entry sides of the connectors. An extra-narrow probe is required for control unit connectors, which are smaller than other types of connector. Do not force a regular-size probe into control unit connectors since this would cause damage.



(2) Inspections with connectors separated

(2.1) Inspections on female terminals

- Perform the inspection by carefully inserting a test probe into the terminals. Do not force the test probe into the terminals since this could deform them and cause poor connections.

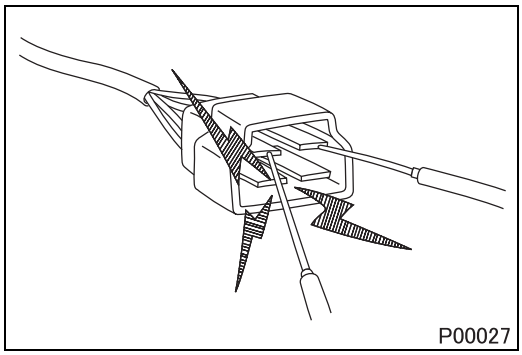


(2.2) Inspections on male terminals

- Perform the inspection by applying test probes directly to the pins.

CAUTION ⚠

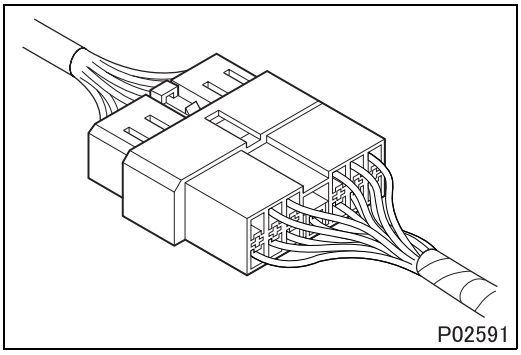
- **Be careful not to short-circuit pins together with the test probes. With control unit connectors, short-circuiting of pins can cause damage to the control unit's internal circuitry.**



- When using a multimeter to check continuity, do not allow the test probes to touch the wrong terminals.

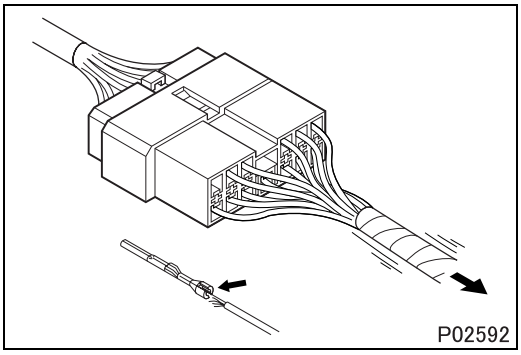
https://truckmanualshub.com/

1.2 Inspection of connectors

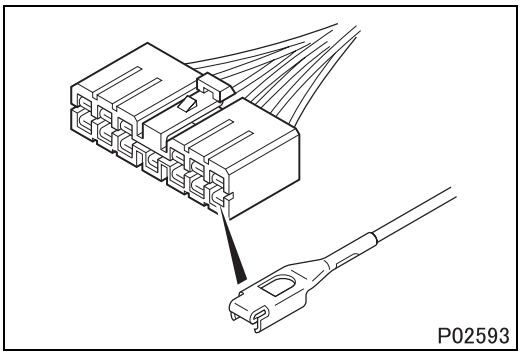


(1) Visual inspection

- Check that the connectors are fitted together securely.

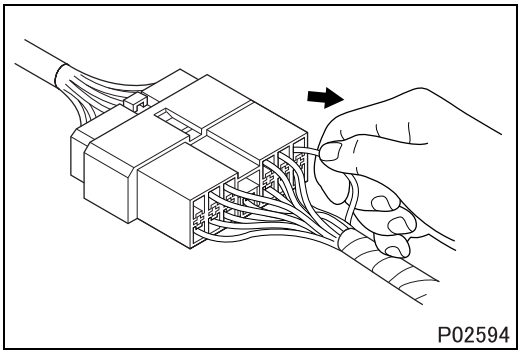


- Check whether wires have been separated from their terminals due to pulling of the harness.



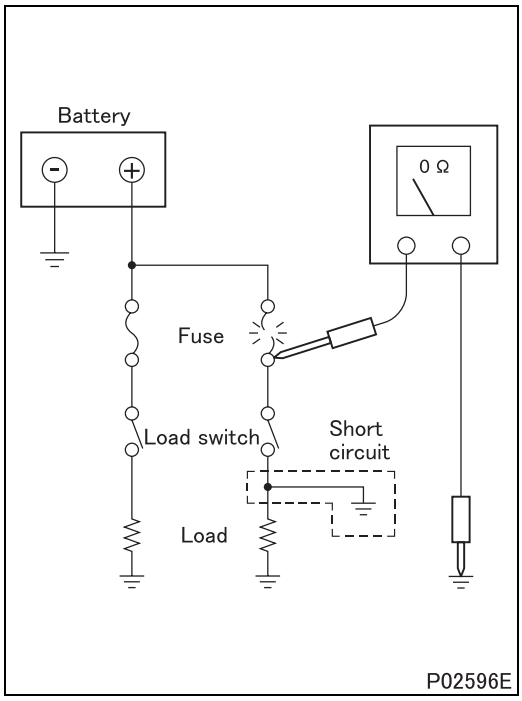
- Check that male and female terminals fit together tightly.
- Check for defective connections caused by loose terminals, by rust on terminals, or by contamination of terminals by foreign substances.

(2) Checking for loose terminals



- If connector terminal retainers become damaged, male and female terminals may not mate with each other when the connector bodies are fitted together. To check for such terminals, gently pull each wire and see whether any terminals slip out of their connector housings.

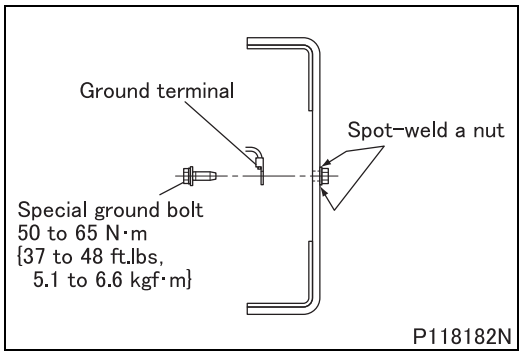
https://truckmanualshub.com/



1.3 Inspections when a fuse blows

- Remove the fuse, then measure the resistance between ground and the fuse's load side.
  Next, close the switch of each circuit connected to the fuse. If the resistance measurement between any switch and ground is zero, there is a short circuit between the switch and the load. If the resistance measurement is not zero, the circuit is not currently short-circuited; the fuse probably blew due to a momentary short circuit.

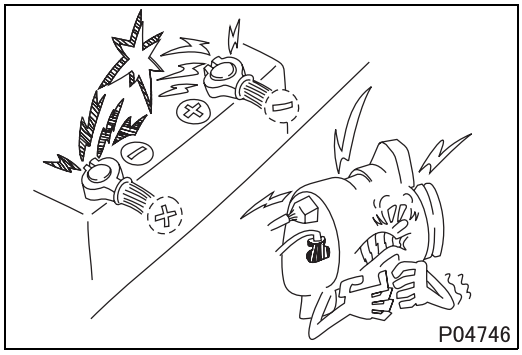
- The main causes of short circuits are as follows:
  - Harnesses trapped between chassis parts
  - Harness insulation damage due to friction or heat
  - Moisture in connectors or circuitry
  - Human error (accidental short-circuiting of components)



1.4 Inspection of chassis ground

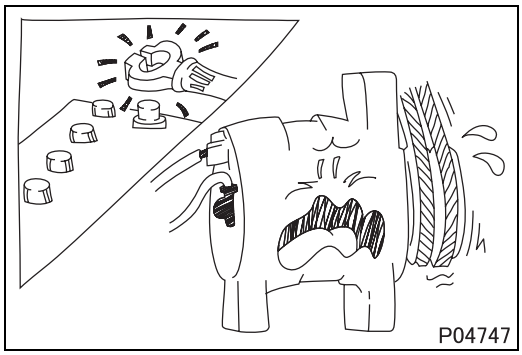
- A special ground bolt is used to tighten a ground terminal. When servicing the ground point, be sure to follow the procedures described below:
  - When reinstalling the ground bolt
    Tighten the ground bolt to the specified torque.
  - When relocating the ground point
    A special ground bolt must be used. Spot-weld a nut to a frame and tighten the ground bolt to the specified torque. Be sure to apply touch-up paint to the welded point.

2. Service Precautions for Alternators

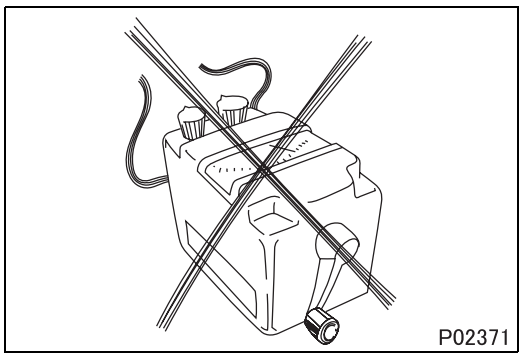


- When servicing alternators, observe the following precautions:
  - Never reverse the polarity of battery connections.
    If the polarity of the battery connections were to be reversed, a large current would flow from the battery to the alternator, damaging the diodes and regulator.

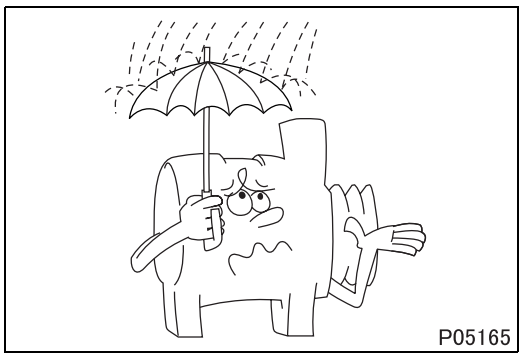
https://truckmanualshub.com/



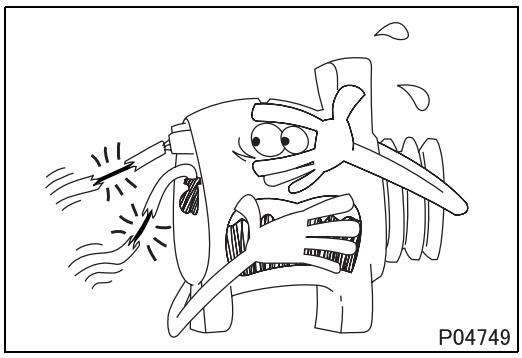
- Never disconnect the battery cables with the engine running.
  Disconnection of the battery cables during engine operation would cause a surge voltage, leading to deterioration of the diodes and regulator.



- Never perform inspections using a high-voltage multimeter.
  The use of a high-voltage multimeter could damage the diodes and regulator.

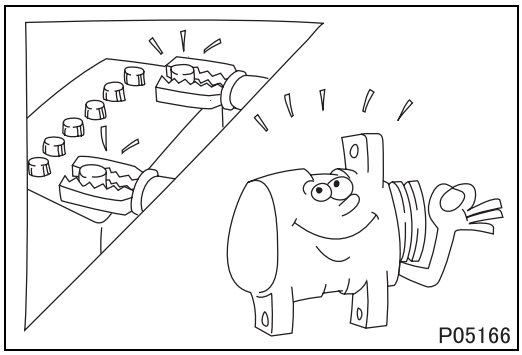


- Keep alternators dry.
  Water on alternators can cause internal short circuits and damage.



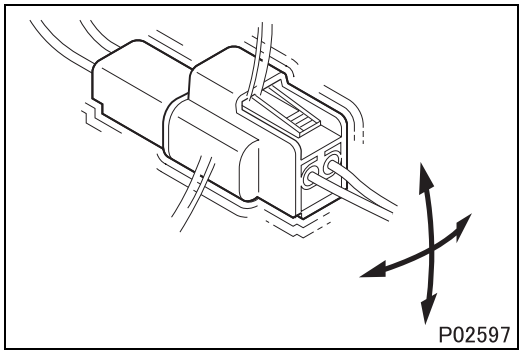
- Never operate an alternator with the B and L terminals short-circuited. Operation with the B and L terminals connected together would damage the diode trio.

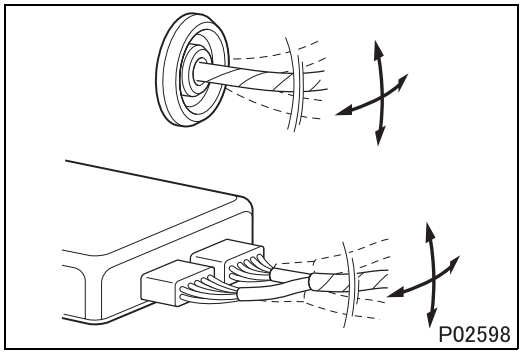
https://truckmanualshub.com/

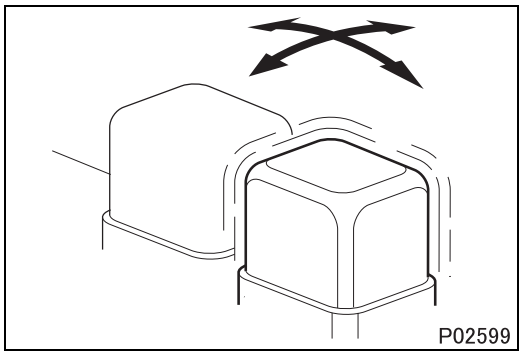


- Disconnect the battery cables before quick-charging the battery with a quick charger.
  Unless the battery cables are disconnected, quick-charging can damage the diodes and regulator.

3. Intermittent Faults







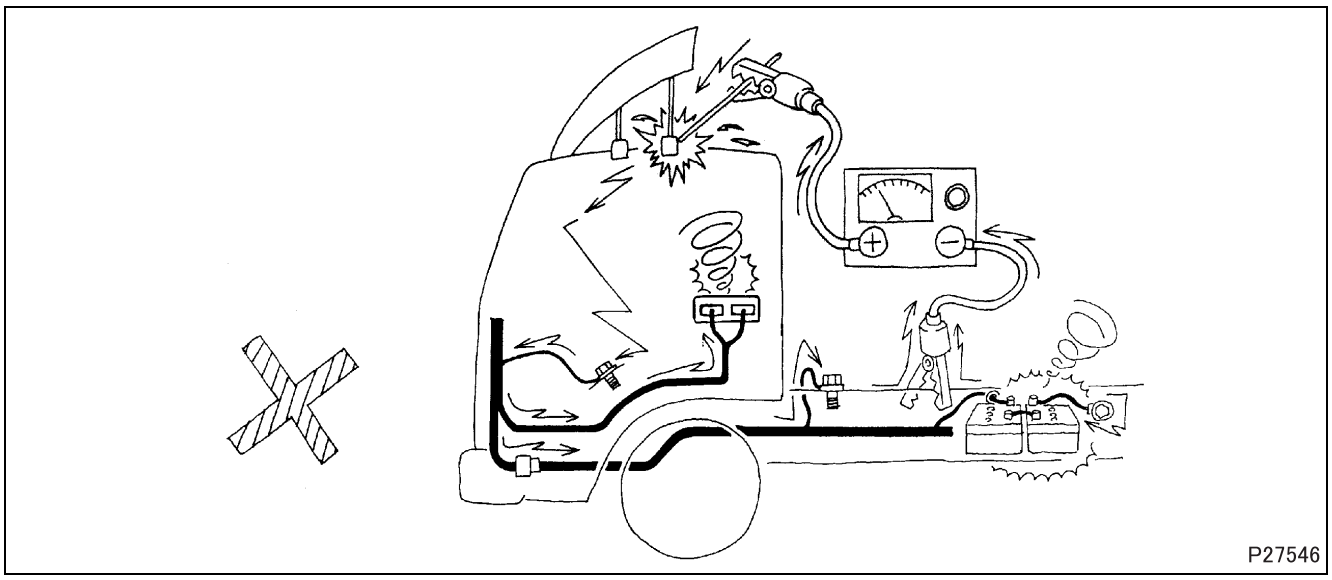
- An intermittent fault typically occurs only under certain operating conditions. Once these conditions have been identified, the cause of the intermittent fault can be ascertained easily. First, ask the customer about the vehicle operating conditions and weather conditions under which the fault occurs. Also ask about the frequency with which the fault occurs and about the fault symptoms. Then, reproduce the fault based on this information.
  In accordance with the conditions under which the fault occurs, determine whether the fault is caused by vibration, heat or other factors. if vibration is a possible factor, see if the fault can be reproduced by performing the following checks on individual connectors and other parts:
  - Gently move connectors up and down and to left and right.
  - Gently move wiring harnesses up and down and to left and right.
  - Gently wiggle sensors and other devices by hand.
  - Gently wiggle wiring harnesses on suspension systems and other moving parts.

- Connectors and other parts to be checked are those included or given as likely fault locations in inspection procedures corresponding to diagnosis codes and/or fault symptoms.

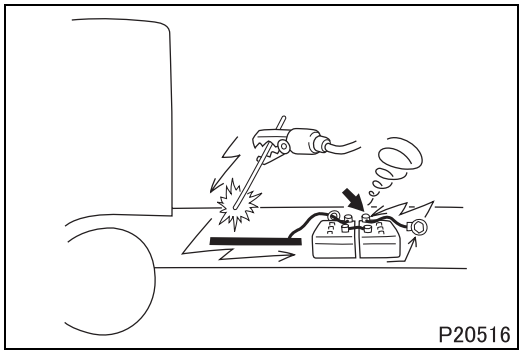
https://truckmanualshub.com/

4. Precautions for Arc Welding

- When arc welding is performed, current from the welder flows to ground via the vehicle's metal parts. Unless appropriate steps are taken, this current can damage control units, other electrical devices and wiring harnesses. And any electrical device near the point on the vehicle to which the (–) cable of the welder is connected, might be largely damaged.



- Current flows backward as shown below.



4.1 From battery (–) cable

To prevent damage to the battery and to electrical devices that are connected directly to the battery, it is essential to disconnect the battery's (–) cable.

4.2 Procedure

- Turn the starter switch to the LOCK position.
- Disconnect the battery's (–) cable.
- Cover all parts of the vehicle that may be damaged by welding sparks.
- Connect the welder's (–) cable to the vehicle as close as possible to the area being welded. Do not connect the welder's (–) cable to the cab if the frame is being welded, and vice versa.
- Set the welding current in accordance with the part being welded.

https://truckmanualshub.com/

5. Cautions When Handling DEF

- DEF is a colorless, transparent, odorless and harmless water solution (urea 32.5%, water 67.5%; freezing temperature –11°C), so no problem will occur if you get it on your skin. However, some persons with delicate skin may in very rare cases get a rash, so carry out the following procedure.
  - If DEF gets into your eyes, immediately wash your eyes with a large amount of water, then see a physician to receive treatment.
  - If DEF gets on your skin, wash it off with water. If there is any change in your skin or it is painful, promptly see a physician to receive treatment.
- Be sure to use DEF that conforms to ISO 22241 (International Organization for Standardization).
- Do not dilute the DEF nor mix the DEF with another reagent. This may cause a malfunction of the selective catalytic reduction system.
- When starting the engine, make sure that there is sufficient amount of DEF in the urea tank.
  If the urea tank is empty, the engine restart will be restricted by the engine restart inhibit control of the urea selective catalytic reduction system.

DEF: Diesel exhaust fluid
ISO: International organization for standardization

6. Precautions When Repainting

- When repainting, cover the following electronic control components with a masking material. If paint get on these components, functional reliability could be deteriorated as a result of the poor connection of connectors, internal circuit failure caused by heat build-up due to poor heat dissipation, erroneous sensor values due to clogged ventilation holes.
  - Engine electronic control unit, DUONIC^{TM} electronic control unit, and other electronic control units
  - Sensors

7. Precautions When Handling a Vehicle with DUONIC^{TM} System

7.1 Test driving

- When rotating only the rear wheels for a certain period of time with the front wheels held using a chassis dynamometer, etc., set the DUONIC^{TM} drive mode to the manual mode (manual shift mode in the hold range).
  At this time, the anti-lock brake system warning and DUONIC^{TM} warning are displayed and the DUONIC^{TM} electronic control unit will shift gears normally due to failure mode control, but there is no problem in test driving in the manual mode.

NOTE

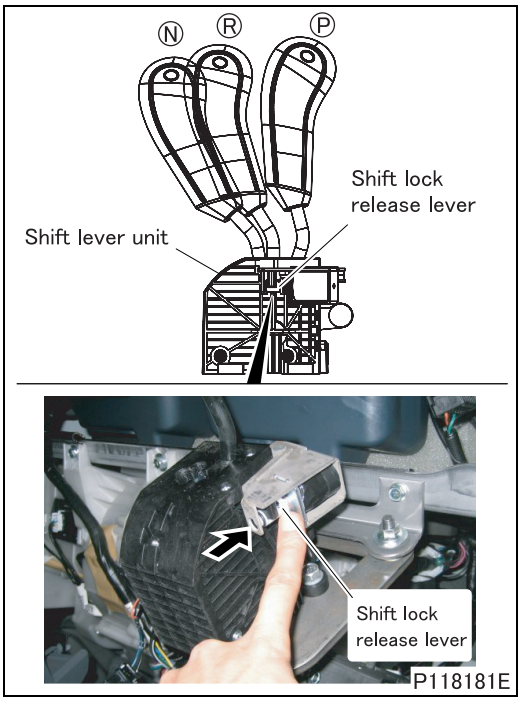
- **Test driving cannot be performed in the drive range because normal shifting is not possible due to failure mode control.**

- Even if the test driving is normally completed, be sure to erase the diagnosis codes for the anti-lock brake system and DUONIC^{TM} system. This is because the diagnosis codes generated at the time of failure remains recognized by the electronic control unit as past diagnosis codes.

7.2 How to release shift lock

- If normal shifting is not possible because the electrical system is not properly connected or the battery has run out, operate the shift lock release lever to make gear shifting possible as follows.

https://truckmanualshub.com/



Operating procedure

- Remove the lower center panel. (See Gr52.)
- Push the shift lock release lever of the shift lever unit approximately 2 mm (0.079 in.) forward in the illustrated direction to unlock the shift lever, then perform gear shifting.

7.3 Towing

- Before towing the vehicle, be sure to remove the propeller shaft to prevent possible damage to the DUONIC^{TM} system.

8. Precautions on Cleaning When Servicing the Engine and Transmission

When servicing the engine or transmission (DUONIC^{TM}), care needs to taken with the following to prevent failures caused by dust and foreign objects.

Works that require care to prevent the entry of dust and foreign objects are marked with  and indicated as “Work that requires dust protection”.

8.1 Work area

- The working place needs to be well organized and kept clean.
- Do not work outdoors. Take dust prevention measures when working indoors. Do not place parts directly on the floor. Put covers on parts to protect them from dust. Keep the over head doors closed unless necessary such as when a vehicle comes in or goes out.
- When servicing components related to the hydraulic circuit of the transmission (DUONIC^{TM}), it is recommended that the work be done in an enclosed environment with a cleanliness level equivalent to that of meeting rooms. If these environmental requirements cannot be satisfied, establish a special procedure to protect the work area for servicing these components from dust. (See Gr22.)

8.2 Clothing and protective wear

- Wear clean working clothes. Do not wear shoes smudged with oil or dirt when working.
- If oil gets on your clothes, immediately wipe it off.
- When a working glove or protective wear becomes dirty or ragged, immediately change it.
- Use of an apron is recommended. (For vehicles with DUONIC^{TM} system.)
- Do not use cotton work gloves. Use rubber or plastic gloves that cover the lower part of your arms. (For vehicles with DUONIC^{TM} system.)

https://truckmanualshub.com/

8.3 Tools

- Common tools, special tools and workbenches used for servicing should be cleaned with a cleaner and rags in advance.
- Whenever a tool or workbench gets damaged or dirty during servicing, immediately clean or replace it.
- Do not use air tools on components related to the hydraulic circuit of the transmission (DUONIC^{TM}). (See Gr22.)

8.4 Washing and drying

- Thoroughly wash the outside of the engine before removing sub-assemblies from the engine.
- After that, remove and disassemble sub-assemblies, then wash each part. The detailed instructions on washing and drying are given in the sections describing washing and inspection procedures and precautions in the engine service manual. Carefully read these instructions to ensure the correct procedures are followed.
- Thoroughly wash the clutch housing before servicing components related to the hydraulic circuit of the transmission (DUONIC^{TM}).
- Use the specified cleaner when washing.
- After washing, dry with compressed air to make sure that foreign objects (such as broken bristles of a cleaning brush) do not remain on parts.

8.5 Rust prevention and removal of rust-preventive agent (for engine)

- If parts are not used immediately after washing, apply the specified rust-preventive agent (such as engine oil).
- Remove rust-preventive agent when installing a part on the engine.
- When installing a new part to which rust-preventive agent has been applied (such as a crankcase), thoroughly wash it to remove rust and rust-preventive agent. Pay special attention to the fuel and oil lines in particular. Follow the procedure given in the engine service manual for the removal of rust-preventive agent.

8.6 New parts (MITSUBISHI genuine parts)

- Have new parts ready in advance.
- To prevent dust from attaching a new part, unpack immediately before the replacement work.
- Oil seals, packings, O-rings and other rubber parts, gaskets and split pins need to be replaced with new parts after each disassembly. Use MITSUBISHI FUSO genuine parts for replacement.
- Since cleanliness assurance requirements are specified to each part and quality is assured for the delivered parts, handle new parts with care so as not to allow the entry of foreign objects.

8.7 Reused parts

8.7.1 Precautions on removal

- Parts removed from engines as well as places where the parts have been removed (intake, exhaust, fuel, lubrication, coolant and other systems) need to be covered with clean paper, rag, plastic sheet, etc. secured with a clean plastic tape if necessary, to prevent the entry of dust.
- Be sure to handle the transmission (DUONIC^{TM}) properly by carefully reading the instructions given in the chassis service manual.
- Since it is not possible to visually check for dust that has entered pipes in particular, cover both ends of a pipe immediately after washing it.

8.7.2 Handling reused parts

- Put removed parts in order for each engine to allow efficient inspection and installation.
- Parts with machined surfaces should not be put directly on the floor. Put these parts on an appropriate wood surface so that the machined surfaces are not damaged.
- Also, other sub-assemblies removed should not be put directly on the floor. Put the sub-assemblies on a clean surface.
- Be sure to handle the transmission (DUONIC^{TM}) properly by carefully reading the instructions given in the chassis service manual.

https://truckmanualshub.com/

8.8 Installation

- Install parts by following the instructions given in the engine and chassis service manuals.
- To prevent the entry of dust and foreign objects during installation, thoroughly check that the parts to be installed are clean and free of foreign objects before installation.
- Blow air into reused parts (piping in the intake and injection systems, etc.) again before installation.

8.9 Fuel

- Use the specified fuel. Use only clean fuel. Do not use contaminated fuel.
- Be sure to observe the following if fuel is stored on the service site.
  - Cover the filler cap of the storage tank to prevent water contamination.
  - Keep the tank clean. In particular, the filler cap and area around the filler port should be kept clean.
  - Position the tank so that it is slightly inclined toward the bottom drain. This facilitates discharging of accumulated water and deposits. Drain off water at least once a month.
  - Keep the tank as full as possible to minimize condensation.
  - After filling the fuel storage tank, wait for a few hours before filling the equipment's tank. This allows contamination to deposit.

8.10 Oils

- Use MITSUBISHI genuine products for the engine oil, transmission gear oil and automatic transmission fluid. Use only clean oils. Do not use contaminated oils.
- It is not recommended to reuse drained oil or automatic transmission fluid. If it is judged that drained oil or automatic transmission fluid can be reused because it is within the replacement interval and is not excessively contaminated, be sure to observe the following.
  - Store the drained oil or automatic transmission fluid in a clean, dedicated container. Do not use containers that were used to store fuel or water.
  - Make sure that the container is appropriately stored so as to prevent the entry of dust and foreign objects.

8.11 Coolant

- Use MITSUBISHI genuine products for the coolant. Use only clean coolant. Do not use contaminated coolant.
- It is not recommended to reuse drained coolant. If it is judged that coolant can be reused because it is within the replacement interval and is not excessively contaminated, be sure to observe the following.
  - Store the drained coolant in a clean, dedicated container. Do not use containers that were used to store fuel or oil.
  - Make sure that the container is appropriately stored so as to prevent the entry of dust and foreign objects.

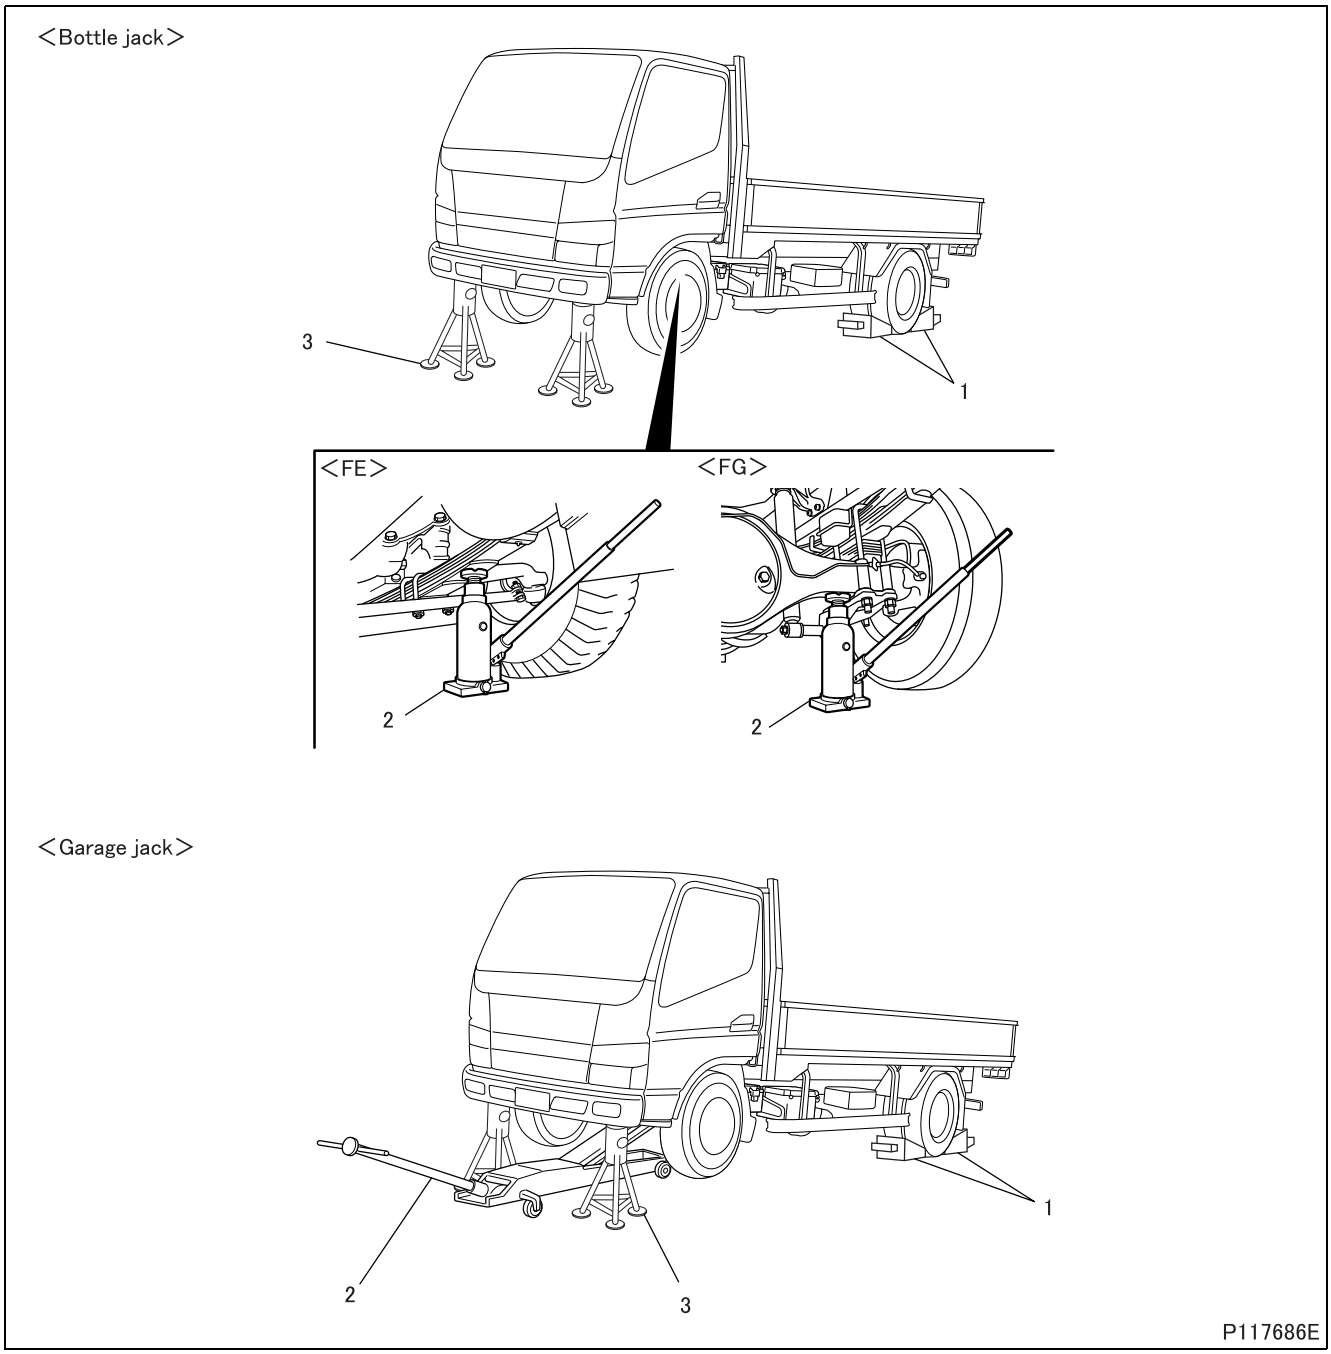
8.12 Miscellaneous

- Thoroughly wash the vehicle before servicing. Do not service a dust covered vehicle.
- The garage air must be clean.
  - Blow air onto white paper to check for the presence of water and/or oil in the air flow.
  - If a problem is found, immediately check the compressor.

https://truckmanualshub.com/

JACKING UP THE VEHICLE

<Front of Vehicle>



Jacking up procedure

1. Place chocks against the rear wheels.
2. Jack up the front of the vehicle with a bottle jack or garage jack.
3. If you use a bottle jack, set it at the jack-up point shown in the figure. If you use a garage jack, set it at the center of the front axle.
4. Support the front of the vehicle frame on jack stands.

https://truckmanualshub.com/

WARNING ⚠

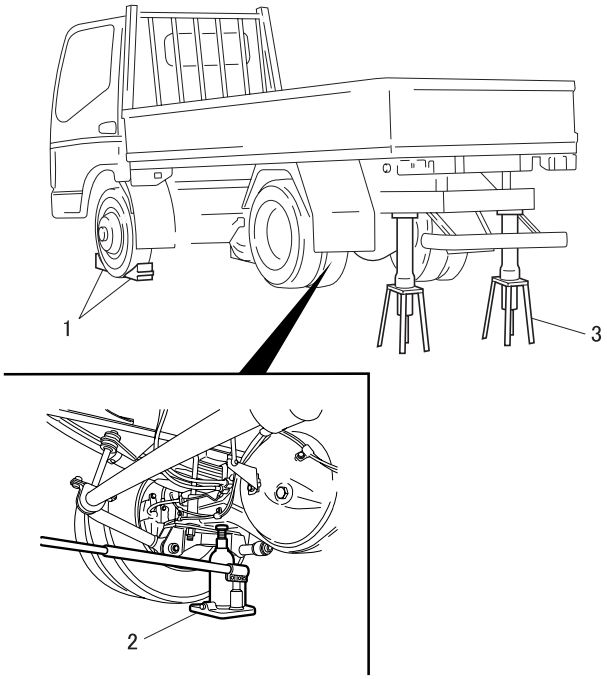
- **Chock the wheels firmly to prevent the vehicle from rolling away.**
- **Do not attempt to remove the chocks until the operation is completed.**
- **It is extremely dangerous to support the vehicle with only bottle jack or garage jack. Be sure to additionally support the front of the vehicle frame on jack stands.**
- **Never attempt to remove the bottle jack, garage jack, or jack stands until the operation is completed.**

https://truckmanualshub.com/

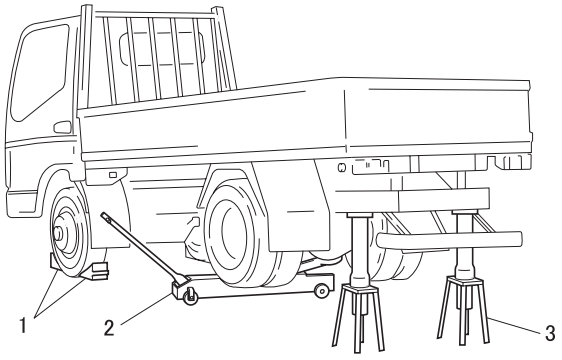
JACKING UP THE VEHICLE

<Rear of Vehicle>

＜Bottle jack＞



＜Garage jack＞



P101652E

Jacking up procedure

1 Place chocks against the rear wheels.
2 Jack up the rear of the vehicle using a bottle jack or garage jack as illustrated above.
3 Support the vehicle frame on jack stands on both sides.

WARNING ⚠

- **Chock the wheels firmly to prevent the vehicle from rolling away.**
- **Do not attempt to remove the chocks until the operation is completed.**
- **It is extremely dangerous to support the vehicle with only bottle jack or garage jack. Be sure to additionally support the vehicle frame on jack stands on both sides.**
- **Never attempt to remove the bottle jack, garage jack, or jack stands until the operation is completed.**

M E M O

https://truckmanualshub.com/

DIAGNOSIS CODES

1. Diagnosis Codes

- The diagnosis system consists of electronic control unit functions to detect failures of electrical components, communicate with diagnosis tools, and update various data.
- When an electronic control unit detects a failure, it stores the failure information as a diagnosis code (that describes a failure of the vehicle) and alerts the user by displaying a warning.
- By reading diagnosis codes and checking for problems accordingly (troubleshooting), failures in electronically controlled systems can be efficiently identified and remedied.
- Diagnosis codes (fault codes) can be displayed in the following two methods:
  - Using the FUSO Diagnostics. (See later section.)
  - Using the multi-information display in the meter cluster. (See later section.)

1.1 Reference Gr list for diagnosis codes

Warning	System	Reference Gr
ENG SYS	Common rail	13E
	BlueTec® system	
T/M SYS	DUONIC™	22E
ABS	Anti-lock brake system	35E
	Immobilizer	54
METER	Meter cluster	54
SAM BAT EQ	Sensor and actuator module	54
–	Fully automatic air conditioner	55E

1.2 Types of diagnosis codes

- There are two types of diagnosis codes: current codes and past codes

1.2.1 Current diagnosis code

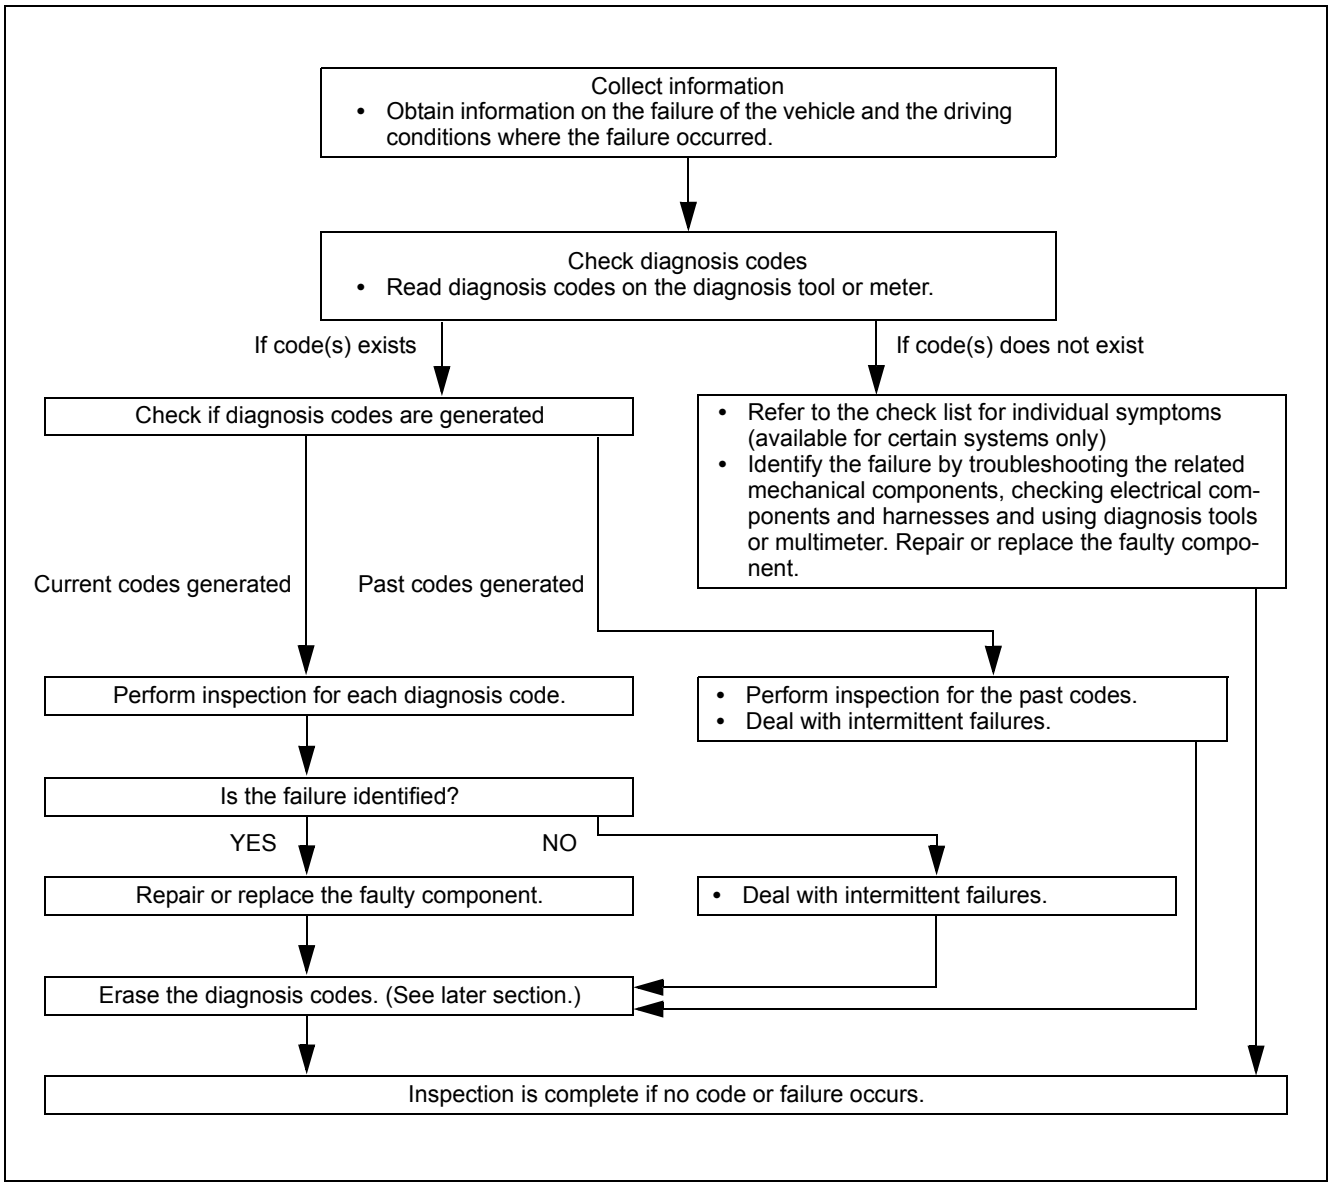
- The current failures in the vehicle can be checked by reading the current diagnosis codes.
- When a current diagnosis code is generated, the warning (or indicator) from the failed system is displayed and its electronic control unit initiates failure mode control such as stopping control or exercising backup control.

1.2.2 Past diagnosis code

- The past failures in the vehicle can be checked by reading the past diagnosis codes.
- When the indication changes from the current diagnosis codes to the past diagnosis codes, the warning (or indicator) showing a failure goes off and the electronic control unit recovers from failure mode control to normal control. (The recovery timing varies depending on the diagnosis code.)
- If the failure has not been resolved, the electronic control unit will detect it again and generate a current diagnosis code.

https://truckmanualshub.com/

1.3 Follow the flowchart below to inspect the system.



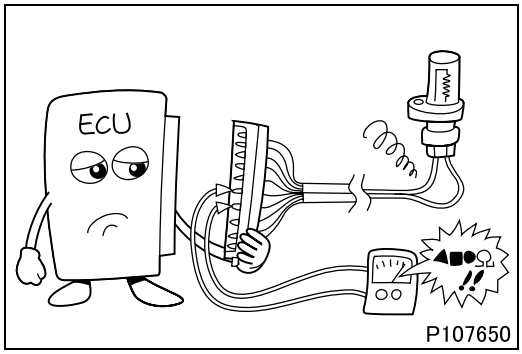
1.4 Precautions on troubleshooting

- Check the charging state and specific gravity of the battery before measuring voltage. If inspection is performed with insufficient charging or specific gravity, accurate measurements may not be displayed.
- Be sure to place the starter switch to the LOCK or OFF position and wait for about 5 minutes before removing battery cables, harnesses or connectors. (This is because the BlueTec® system is still in operation.)
- When installing battery cables, harnesses or connectors, place the starter switch and lighting switch to the LOCK or OFF position. Otherwise, electrical components could be damaged.
- When measuring with a multimeter, carefully handle the test bars so that the bars do not short-circuit between connector pins or with the body. Otherwise, electronic control units' internal circuits and electrical components could be damaged.
- Since resistance values are affected by temperature, refer to the descriptions on temperature in this manual as a guideline for pass/fail judgment. If temperature is not specified, normal temperature (10 to 35°C {50 to 95°F}) is assumed.

https://truckmanualshub.com/

1.5 Inspecting the input and output signals at the electronic control unit connector

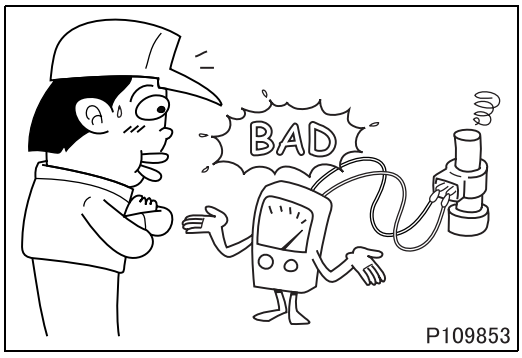
- This inspection is to confirm that signals from electronic control units and electrical components are correctly transmitted to the harnesses and connectors on the vehicle side.



- This inspection includes the following checks:
  - Measure the input voltage of switches and sensors and the output voltage of relays to check for open circuit and short circuit to battery or ground by inserting the test bars from the back side of the connector with the harness (on the electronic control unit connector) on the vehicle side connected.
  - Measure the resistance of temperature sensors, rotation sensors and solenoids to check for open circuit by disconnecting the electronic control unit connector and inserting the test bars into the harness on the vehicle side.
  - Check the operation of magnetic valves for open circuit and valve failure by disconnecting the electronic control unit connector and applying a voltage from the harness on the vehicle side.
- Some electronic unit connectors are equipped with water- or dust-proofing treatment and do not allow test probes to be inserted from the back side of the connectors.

1.6 Inspecting the electrical components

- This inspection is to check that electrical components are operating normally.

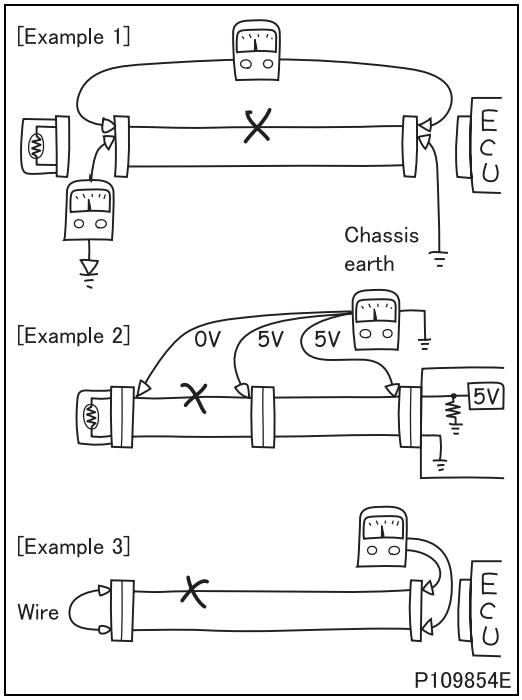


- This inspection includes the following checks:
  - Check if electrical components actually operate.
  - Check the internal circuits of electrical components for open and short circuit.
  - Check the characteristics of the output signals from electrical components.
- Operation or signal characteristics checking is not easy on some electrical components, for which only electrical checking for open and short circuit is performed. As a result, there may be cases where a mechanical failure exists in these components even if they are electrically normal. Therefore, it is necessary to make a pass/fail judgment on these electrical components by checking the overall system operation and the related components such as harnesses and connectors.

https://truckmanualshub.com/

1.7 Inspecting the harnesses

- This inspection is to check for faulty sections of harnesses and connectors.



1.7.1 Open circuit

- An open circuit means a harness is broken.

[Inspection example 1]

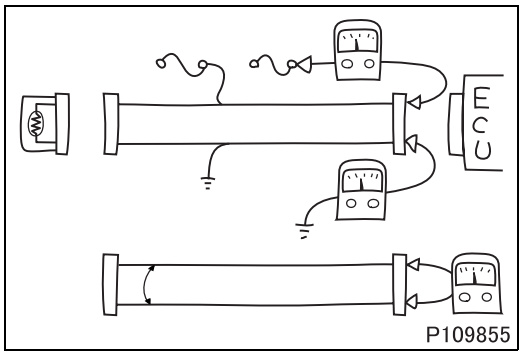
- Measure the resistance between components to confirm that that there is continuity. Gently shake the harness up and down while measuring.
- If the connectors to be measured are far apart from each other, chassis ground may be used.
  Standard value: Less than 5 Ω
- If the measurement is out of the standard value, there is an open circuit in the harness or a poor connection of pins in the connector.

[Inspection example 2]

- Measure voltage from the back side of each connector. Gently shake the harness up and down while measuring.
- If there is a voltage drop, there is an open circuit in the harness in that section or a poor connection of pins in the connector.

[Inspection example 3]

- Connect a wire or equivalent to the component side and measure the resistance between adjacent harnesses. Gently shake the harnesses up and down while measuring.
- If the measurement is out of the standard value shown above, there is an open circuit in the harnesses or a poor connection of pins in the connector.



1.7.2 Short circuit

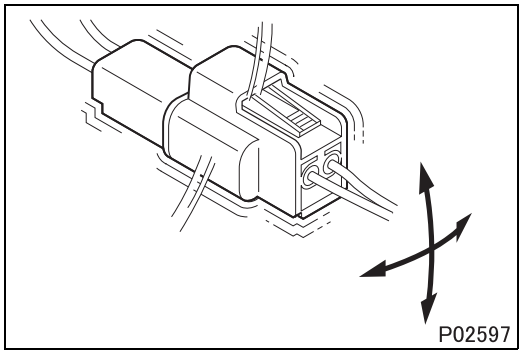
- A short circuit means a harness is in contact with another harness. A large current may occur if the power supply harness directly touches a grounding harness without going through a load.
- A short circuit to power refers to a short circuit to the power supply line carrying the same voltage as the battery voltage. A short circuit to ground refers to a short circuit to a grounding line.

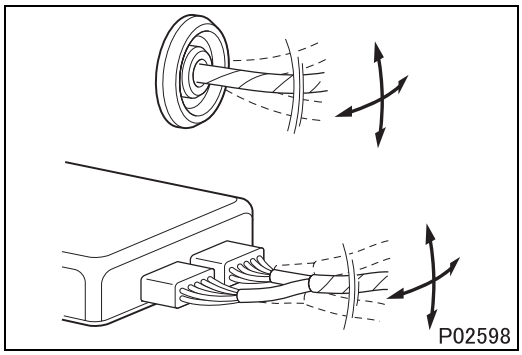
[Inspection example]

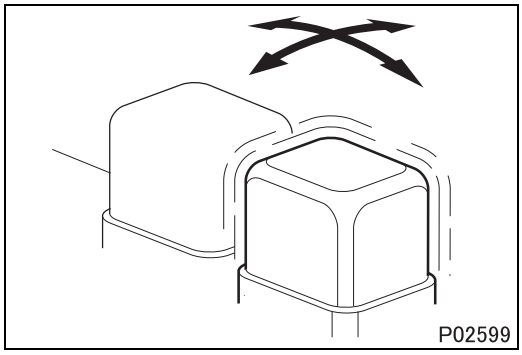
- Check the following to confirm that there is no continuity. Gently shake the harness up and down while measuring.
  - Measure the resistance between the pins to be inspected.
  - Measure the resistance between the pin to be inspected and a power line. (short circuit to power)
  - Measure the resistance between the pin to be inspected and a grounding line or chassis ground. (short circuit to ground)
    Standard value: More than 1 MΩ
- If the measurement is out of the standard value, there is a short circuit in the harness or in the connector.

https://truckmanualshub.com/

1.8 Intermittent faults







- An intermittent fault typically occurs only under certain operating conditions. Once these conditions have been identified, the cause of the intermittent fault can be ascertained easily. First, ask the customer about the vehicle operating conditions and weather conditions under which the fault occurs. Also ask about the frequency with which the fault occurs and about the fault symptoms. Then, reproduce the fault based on this information.
  In accordance with the conditions under which the fault occurs, determine whether the fault is caused by vibration, heat or other factors. if vibration is a possible factor, see if the fault can be reproduced by performing the following checks on individual connectors and other parts:
  - Gently move connectors up and down and to left and right.
  - Gently move wiring harnesses up and down and to left and right.
  - Gently wiggle sensors and other devices by hand.
  - Gently wiggle wiring harnesses on suspension systems and other moving parts.

- Connectors and other parts to be checked are those included or given as likely fault locations in inspection procedures corresponding to diagnosis codes and/or fault symptoms.

https://truckmanualshub.com/

1.9 Diagnosis tool functions and available tests

1.9.1 Basic functions

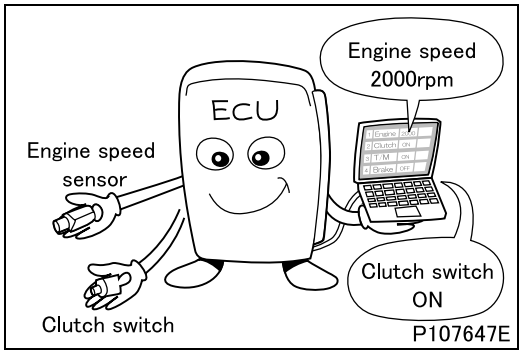
- The basic functions of the diagnosis tools include the readout of diagnosis codes and control information from electronic control units. Efficient troubleshooting can be made by using these functions. A writing function is also provided to allow registering or changing information on electronic control units.
- If you perform a short test with the FUSO Diagnostics, the systems on the vehicle that support the FUSO Diagnostics are automatically determined and a list of the current diagnosis codes (fault codes) is displayed.
- Failures can be efficiently identified and removed by reading diagnosis codes and taking actions (troubleshooting) accordingly.

(1) Reading diagnosis codes

- By reading diagnosis codes, failures in the vehicle can be efficiently identified and remedied.

(2) Reading service data (measured values)

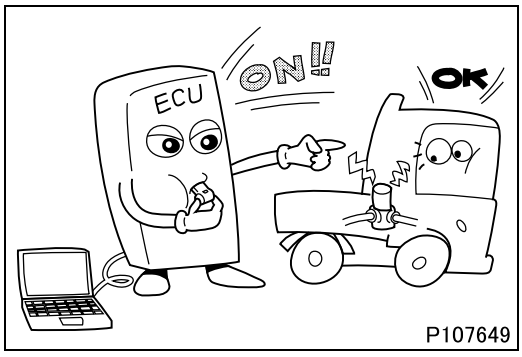
- Service data shows the values and information used for control by an electronic control unit, allowing you to check if the switches, sensors, harnesses or connectors that provide the information are operating normally.



- The following types of service data are available (which varies depending on the electronic control unit):
  - Input or calculated values from switches, sensors and other electronic control units
  - Output values to relays and actuators
  - Vehicle specifications stored in the electronic control unit
- If backup values are displayed as service data, the electrical component or harness associated with the service data is faulty.
- Since some systems store related service data when a diagnosis code is generated as freeze frame data, there may be cases where the cause of a failure can be presumed without reproducing the failure.

(3) Performing the actuator test (control)

- By performing an actuator test, functions of an electrical component or electronic control unit can be easily activated to check if the component or unit is faulty or not. Since operation checks can be performed without driving the vehicle, greater efficiency and safety of troubleshooting are assured.



- The following types of actuator tests are available (which varies depending on the electronic control unit):
  - Make an electrical component operate to determine and check failures.
  - Input pseudo signals to an electronic control unit (e.g. a signal that tells the unit that a switch is set to ON regardless of the actual position of the switch).
- In actuator tests, service data may be displayed as “Operating” even if the electrical component is not operating normally. Therefore, also check for operation sound, etc. to make sure.
- When an electronic control unit is exercising failure mode control, the unit may not activate the actuator even if an actuator test is performed (depending on the electronic control unit and failure conditions).

https://truckmanualshub.com/

(4) Registering, changing and resetting the specifications and parameters of electronic control units and coding such as calibration

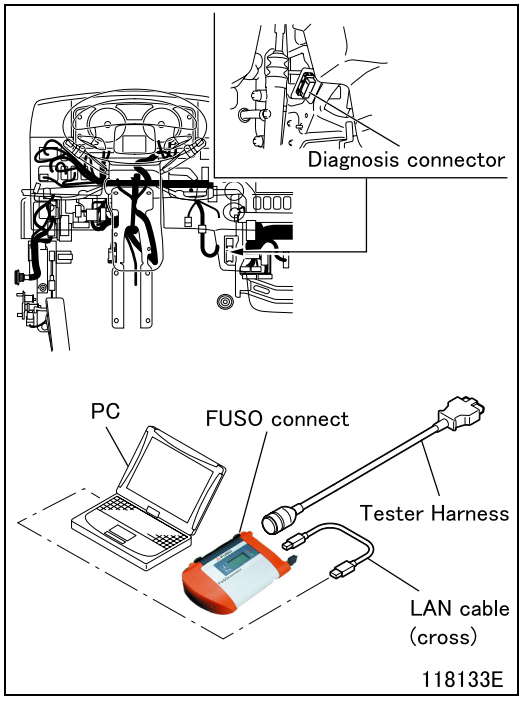
- It is possible to check the specifications and parameters stored in electronic control units, register, change, or reset the parameters or data upon replacement of related components, and update learned values.

2. Reading and Erasing the Diagnosis Code

2.1 Using the FUSO Diagnostics

Special tools

Mark	Tool name and shape	Part No.	Application
ⓒa	PC  P57295	FDS-R10-6 or higher (FUSO Diagnostics version)	Data transmission between FUSO connect and PC
ⓒb	FUSO Connect  111971	MH064036	Data transmission between electronic control unit and PC
ⓒc	FUSO Diagnostics test harness  P113938	MH062998	Power supply to FUSO connect and communication with electronic control unit

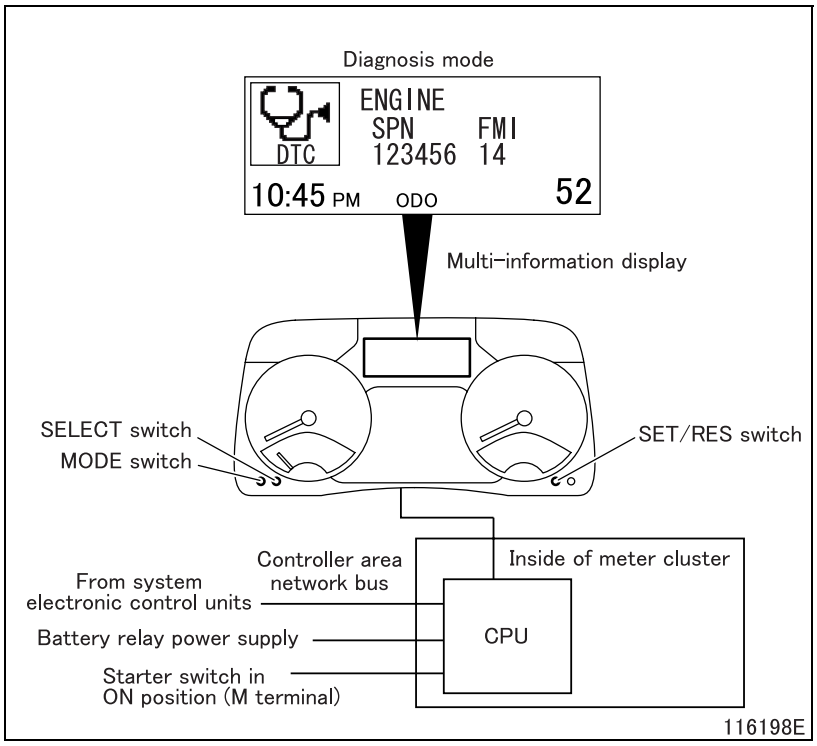


(1) Connecting the FUSO Diagnostics

- Turn the starter switch to the LOCK position.
- Connect ⓒa, ⓒb, ⓒc and LAN cable (cross cable; category 5 or higher).
- Connect the diagnostic connector to the ⓒc connector.

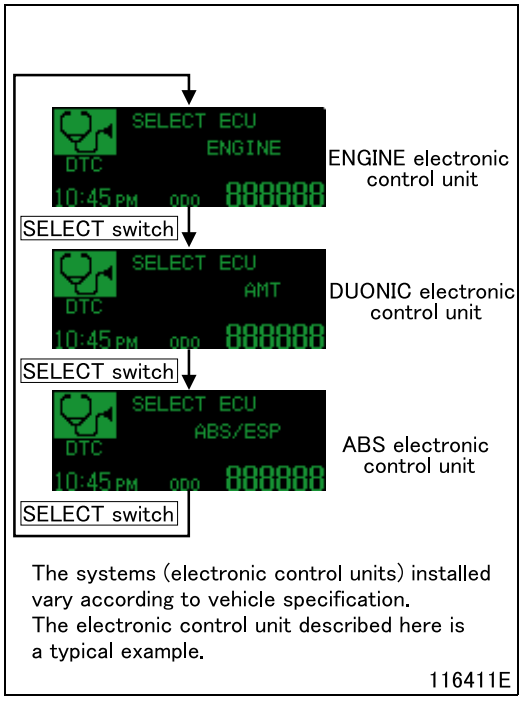
https://truckmanualshub.com/

- Even if the FUSO Diagnostics is not available, you can display or erase diagnosis codes by using the multi-information display on the meter cluster as follows.



(1.1) Preparations for system inspection

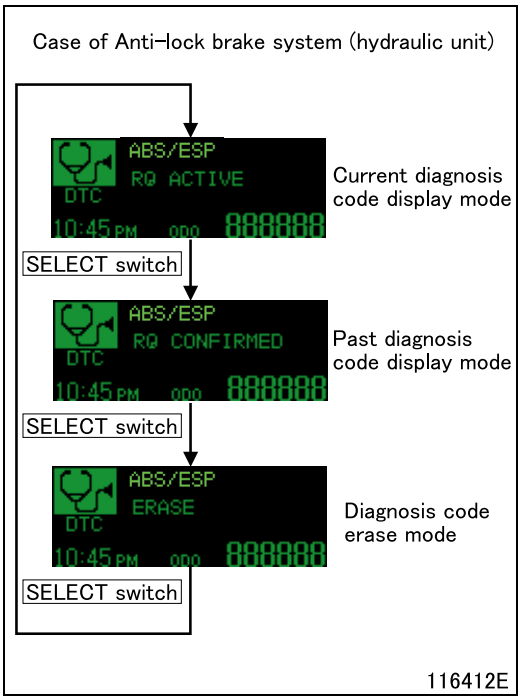
- Stop the vehicle.
- Turn the starter switch ON.
- Press the SELECT, MODE and SET/RES switches simultaneously.
- The multi-information display in the meter cluster enters the diagnosis mode.



(1.2) System (electronic control unit) selection mode

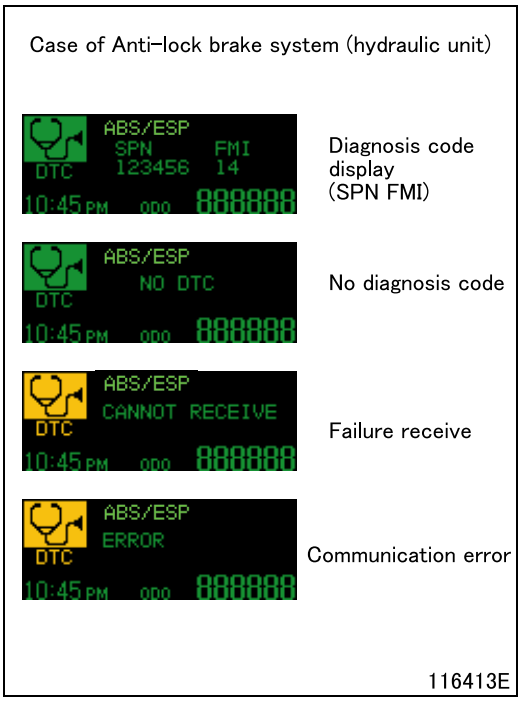
- Press the SELECT switch to select the system (electronic control unit) to be checked.
- Press the SET/RES switch to enter the function selection mode.

https://truckmanualshub.com/



(1.3) Function selection mode

- Press the SELECT switch to select the desired mode.
- Press the SET/RES switch to enter one of the following modes:
  - Current diagnosis code display mode
  - Past diagnosis code display mode
  - Diagnosis code erase mode
- When the MODE switch is pressed, the system (electronic control unit) selection mode will be entered.



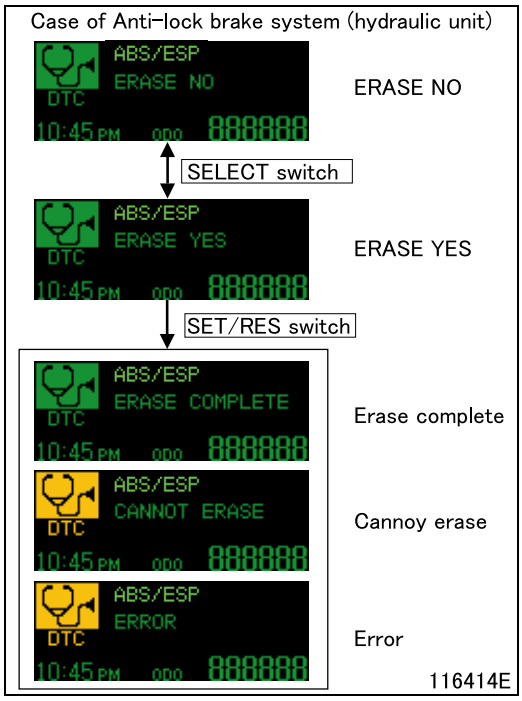
(1.4) Current and past diagnosis code display modes

- Generated diagnosis codes are displayed. When two or more diagnosis codes have been generated, they are displayed in turns at 3-second intervals. If there is no diagnosis code, “NO DTC” is displayed.
- If “ERROR” or “CANNOT RECEIVE” is displayed during communication, perform the operation again.
- When the MODE switch is pressed, the function selection mode will be entered.

NOTE

- **For the engine electronic control unit, check the diagnosis code shown in the “RQ CONFIRMED” screen.**
- **For the engine electronic control unit, “RQ ACTIVE” is not a diagnosis code indicating a failure.**

https://truckmanualshub.com/



(1.5) Diagnosis code erase mode

- If the SET/RES switch is pressed in the “ERASE YES” screen, all diagnosis codes stored in the selected electronic control unit will be erased and “ERASE COMPLETE” will be displayed.
- If “CANNOT ERASE” or “ERROR” screen is displayed, connect the FUSO Diagnostics to check each system and take necessary actions.
- When the MODE switch is pressed, the function selection mode will be entered.
- When the SET/RES switch is pressed in the “ERASE NO” screen, the function selection mode will be entered.

https://truckmanualshub.com/

TABLE OF STANDARD TIGHTENING TORQUES

- Use specified bolts and nuts, tightening them to the torques specified in this section unless otherwise stated.
- Threaded portions and bearing surfaces should be dry.
- Where the property class differs between the nut and bolt (or stud bolt), use the tightening torque specified in the table for the bolt.

Hexagon Headed Bolt, Stud Bolt (Unit: N·m {ft.lbs, kgf·m})

Strength	4T		7T		8T	
Identification symbol Nominal diameter						
M5	2 to 3 {1.5 to 2.2, 0.2 to 0.3}	–	4 to 6 {3.0 to 4.4, 0.4 to 0.6}	–	5 to 7 {3.7 to 5.2, 0.5 to 0.7}	–
M6	4 to 6 {3.0 to 4.4, 0.4 to 0.6}	–	7 to 10 {5.2 to 7.4, 0.7 to 1.0}	–	8 to 12 {5.9 to 8.9, 0.8 to 1.2}	–
M8	9 to 13 {6.6 to 9.6, 0.9 to 1.3}	–	16 to 24 {12 to 18, 1.7 to 2.5}	–	19 to 28 {14 to 21, 2.0 to 2.9}	–
M10	18 to 27 {13 to 20, 1.8 to 2.7}	17 to 25 {13 to 18, 1.8 to 2.6}	34 to 50 {25 to 37, 3.5 to 5.1}	32 to 48 {24 to 35, 3.3 to 4.9}	45 to 60 {33 to 44, 4.5 to 6.0}	37 to 55 {27 to 41, 3.8 to 5.7}

HOW TO READ THE MAINTENANCE SCHEDULE TABLES

Example Table:

Ⓔ: Exhaust emission items.
Ⓝ: Noise control items.

Item (1)	Time of inspection and maintenance (2)									Working procedures (3)	Reference Gr (4)
			Inspection interval								
	Pre-operational checks	New vehicle at 4,000 km/ 2,500 miles	Every 10,000 km/ 6,000 miles	Every 20,000 km/ 12,000 miles	Every 30,000 km/ 18,000 miles	Every 40,000 km/ 24,000 miles	Every 50,000 km/ 30,000 miles	Every 90,000 km/ 54,000 miles	Every 250,000 km/ 150 ,000 miles		
ENGINE											
Fuel, oil, or coolant leaks from engine	×									Check engine for fuel, oil and coolant leaks.	Gr11, 12 13A, 14
ⒺⓃ Engine conditions	×									Check the engine for smooth starting and quiet running.	Gr11, 13 15, 17, 54
Manifold bolts and nuts torque							×			Check inlet exhaust manifold dolts and nuts for looseness.	Gr15
Ⓔ Check and adjust valve clearance		×					×			Check valve clearance with thickness gauge.	Gr11
Ⓔ Oil filter replacement			Every 10,000 km/6,000 miles or 12 months							Replace oil filters	Gr12

(1) This column contains the maintenance and inspection items.

(2) The periods between inspection and service are based on the assumption that the vehicle will be driven approximately 60,000 kilometers (36,000 miles) per year.
Inspections which must be made are indicated by an "×" or by the appropriate period between servicing.

(3) This column provides a simplified explanation of the operational procedures involved for each inspection or maintenance item.

(4) The Gr. No. refers to the "group number" in this Service Manual. For visual checks and simple inspections, see the sections labelled "Working Procedures".

MAINTENANCE SCHEDULE TABLES

Ⓔ: Exhaust emission items.
Ⓝ: Noise control items.

Item	Time of inspection and maintenance									Working procedures	Reference Gr
	Pre-operational checks	1st maintenance at 4,000 km/2,500 miles	Inspection interval: Every 10,000 km/6,000 miles	Every 20,000 km/12,000 miles	Every 30,000 km/18,000 miles	Every 40,000 km/24,000 miles	Every 50,000 km/30,000 miles	Every 90,000 km/54,000 miles	Every 250,000 km/150,000 miles		
ENGINE											
Leakage of coolant, fuel and oil	×									Check the underneath of the vehicle for any sign of leakage.	Gr11, 12, 13, 14
ⒺⓃ Engine conditions	×									Check the engine for smooth starting and quiet running.	Gr11, 13, 15, 17, 54
Ⓔ Oil filter replacement			Every 30,000 km/18,000 miles or 12 months							Replace oil filters.	Gr12
Ⓔ Fuel filter replacement			Every 30,000 km/18,000 miles or 12 months							Replace fuel filter.	Gr13
Ⓔ Fuel line leakage and damage			Every 30,000 km/18,000 miles or 12 months							Check for leakage of fuel from the fuel line. Check the pipe, hose and tube for damage and loose installation.	Gr13
ⒺⓃ Belts tension and damage			Every 30,000 km/18,000 miles or 12 months							Inspect belts for crack, wear and tension.	Gr14
V-belt replacement			Every 120,000 km/72,000 miles or 24 months							Replace V-belt	Gr13
Ⓔ Cooling system			Every 30,000 km/18,000 miles or 12 months							Check radiator and pressure cap for sealing performance and mounting condition. Inspect hoses for looseness, deterioration, damage causing leakage. Remove dust and foreign matter deposit from radiator and intercooler front.	Gr14
Coolant level	×									Check that the coolant level is between the “FULL” and “LOW” marks on the reservoir tank.	Gr14
Coolant replacement			Every 24 months							Replace coolant.	Gr14
ⒺⓃ Air cleaner element replacement			Every 30,000 km/18,000 miles or 12 months							Replace air cleaner element.	Gr15
ⒺⓃ Exhaust system			Every 30,000 km/18,000 miles or 12 months							Inspect the exhaust system for damage, corrosion and loose connection causing leakage.	Gr15
Ⓔ DPF			Every 30,000 km/18,000 miles or 12 months							Check the diesel particulate filter for damage and exhaust gas leaks. Check for loose mounting bolts and nuts. Check the mounting brackets for damage.	Gr15
DEF line leakage and damage			Every 30,000 km/18,000 miles or 12 months							Check for leakage of Diesel Exhaust Fluid from the DEF line. Check the pipe, hose and tube for damage and loose installation.	Gr17

https://truckmanualshub.com/

Item	Time of inspection and maintenance									Working procedures	Reference Gr
			Inspection interval								
	Pre-operational checks	1st maintenance at 4,000 km/2,500 miles	Every 10,000 km/ 6,000 miles	Every 20,000 km/ 12,000 miles	Every 30,000 km/ 18,000 miles	Every 40,000 km/ 24,000 miles	Every 50,000 km/ 30,000 miles	Every 90,000 km/ 54,000 miles	Every 250,000 km/ 150,000 miles		
Alternator tensioner replacement			Every 240,000 km/144,000 miles or 60 months							Replace alternator and tensioner	Gr14
Glow plug replacement			Every 240,000 km/144,000 miles or 60 months							Replace glow plug	Gr11
POWER TRAIN											
Propeller shaft flange torque and universal joint looseness		×	Every 30,000 km/18,000 miles or 12 months							Check flange yoke bolts for looseness and universal joint for play.	Gr25
Propeller shaft center bearing			Every 60,000 km/36,000 miles or 24 months							Check center bearing if trace of grease flowing out is evident. Check center bearing for wear, damage and play.	Gr25
FRONT AND REAR AXLE											
Wheel hub bearing			Every 60,000 km/36,000 miles or 12 months							Check wheel hub bearing for play.	Gr26, 27
Wheel hub bearing hub seals replacement			Every 60,000 km/36,000 miles or 12 months							When wheel hub bearing grease is replaced, also replace the wheel hub bearing hub seals.	Gr26, 27
Wheel and tire	×									Measure inflation pressure with tire gauge.	Gr31
	×		Every 30,000 km/18,000 miles or 12 months							Check disc wheel for corrosion, deformation and cracks. Check tire tread and side wall for cracks and damage. Measure tire tread groove depth to make sure it is deep enough. Check tire tread for uneven wear, stepped wear and other abnormal wear.	
			Every 30,000 km/18,000 miles or 12 months							Rotate all tires.	See later section.
Tie rod ball joint dust boots			Every 30,000 km/18,000 miles or 12 months							Check the ball joint dust boots for cracks and wear.	Gr37
Wheel nut looseness		×	Every 30,000 km/18,000 miles or 12 months							Check wheel nuts for looseness. Check at the first 50 to 100 km/30 to 60 miles after changing a wheel.	Gr31
SUSPENSION SYSTEM											
Suspension springs	×									Check for broken springs and tilt of vehicle body toward either side.	Gr33, 34
U-bolts looseness		×	Every 30,000 km/18,000 miles or 12 months							Check U-bolt nuts for looseness. Check at the first 1,000 km/600 miles after removing and retightening U-bolt nuts.	Gr33, 34
BRAKING SYSTEM											
Service brake pedal	×									Check brake pedal play and stroke.	Gr35

https://truckmanualshub.com/

MAINTENANCE SCHEDULE TABLES

Item	Time of inspection and maintenance									Working procedures	Reference Gr
			Inspection interval								
	Pre-operational checks	1st maintenance at 4,000 km/2,500 miles	Every 10,000 km/ 6,000 miles	Every 20,000 km/ 12,000 miles	Every 30,000 km/ 18,000 miles	Every 40,000 km/ 24,000 miles	Every 50,000 km/ 30,000 miles	Every 90,000 km/ 54,000 miles	Every 250,000 km/ 150,000 miles		
Brake performance	×									Press the brake pedal and check that the brakes work effectively and evenly on all wheels.	Gr35
Disc brake pad and disc			Every 30,000 km/18,000 miles or 12 months							Check disc brake pad and disc for damage and wear.	Gr35
Brake lining			Every 30,000 km/18,000 miles or 12 months							Check lining for wear through inspection hole.	Gr35
Brake drum			Every 30,000 km/18,000 miles or 12 months							Disassemble and check drum for wear, crack and damage.	
Parking brake lever stroke	×									Check parking brake lever stroke.	Gr36
Looseness, play and damage of brake system parts			Every 30,000 km/18,000 miles or 12 months							Inspect brake lines and hoses looseness, play and damage. Inspect wheel cylinder and brake master cylinder for looseness, play and damage.	Gr35
STEERING SYSTEM											
Steering wheel play	×									Turn steering wheel right and left to measure play at steering wheel rim. Measure while engine is running.	Gr37
Steering wheel operation	×									Check that the steering wheel does not vibrate or pull to one side and that it is not unduly heavy. Also make sure that the steering wheel returns to its neutral position smoothly.	Gr37
Steering system			Every 30,000 km/18,000 miles or 12 months							Check steering system for looseness, steering wheel play and operating condition. Inspect for oil leaks, booster and oil pump function.	Gr37
Drag link ball joint dust cover			Every 30,000 km/18,000 miles or 12 months							Check the dust cover for wear, cracks and other damage.	Gr37
CAB											
Defroster	×									Make sure that warm air blows properly onto the windshield.	Gr55
Rearview mirrors	×									Seated in the driver's seat, adjust the angles for clear views of the sides and rear. Make sure the mirrors are clean.	Gr51
License plate and reflector condition	×									Check the license plate and reflectors for loose installation, damage, and dirt.	–
Door locks	×									Push down the lock knob and verify that the door does not open even when the inner handle is operated.	Gr43

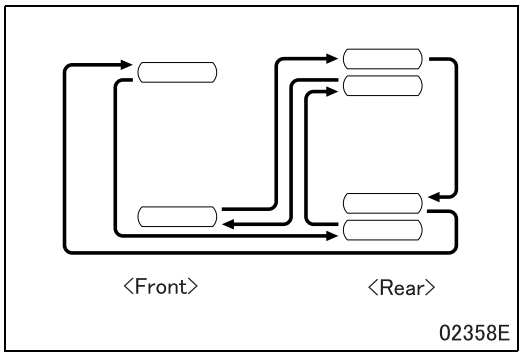
https://truckmanualshub.com/

Item	Time of inspection and maintenance									Working procedures	Reference Gr
			Inspection interval								
	Pre-operational checks	1st maintenance at 4,000 km/2,500 miles	Every 10,000 km/ 6,000 miles	Every 20,000 km/ 12,000 miles	Every 30,000 km/ 18,000 miles	Every 40,000 km/ 24,000 miles	Every 50,000 km/ 30,000 miles	Every 90,000 km/ 54,000 miles	Every 250,000 km/ 150,000 miles		
Seat belts	×									Confirm that the seat belt buckles function correctly when fastening and unfastening.	Gr52
ELECTRICAL SYSTEM											
Horn operation	×									Press the horn button to check that the horn is working properly.	Gr54
Windshield washer fluid level	×									Confirm that the windshield washer fluid level is above the bottom of the inspection window.	–
Windshield wiper and washer operation	×									Check the washer for proper fluid spray direction and the wipers for normal action.	Gr51, 54
Lighting system	×									Make sure that each lamp lights up or flashes properly. Check lamp lenses for dirt and damage.	Gr54
Gauge, warning/indicator lamp operation	×									Check that gauges, warning lamps and indicators are working properly.	Gr54
Battery	×									Check the battery fluid level.	Gr54

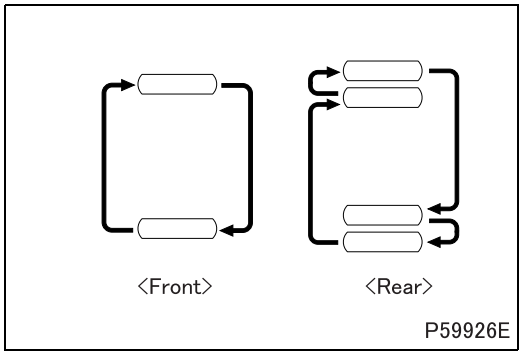
https://truckmanualshub.com/

Tire rotation

Tires wear differently, according to the location where they are mounted. To make this wear uniform and prolong the life of your tires, they should be rotated every 10,000 km (6,000 miles) in the rotation order shown below:



- When the tread patterns for all tires are identical:



- When the tread patterns are different for the front and rear tires:

CAUTION ⚠

- **Always adjust air pressure after running-in new tires.**
- **When using tires of different tread patterns, use rib-type patterns for the front tires and traction type patterns for the rear tires.**
- **Avoid using both radial and biased tires on the same vehicle.**

Clutch control fluid replacement			Every 60,000 km/36,000 miles or 24 months					Automatic transmission fluid FUSO ATF SP3	Gr22
Transfer gear oil replacement <FG model only>			Every 60,000 km/36,000 miles or 24 months					Gear oil API classification GL-3 SAE 80 (general) GL-3 SAE 90 (warm region) GL-4 SAE 90 (tropical region)	Gr24
Rear axle housing gear oil replacement			Every 60,000 km/36,000 miles or 24 months					Gear oil API classification GL-5 Below 40°C {104°F} SAE 90 Over 40°C {104°F} SAE 140 or 85W-140 Use SAE 140 or 85W-140 when operating vehicle at high load, such as continuous ascent on slopes and when the outside temperature is 10°C {50°F} or more <Limited slip differential only> Limited slip differential oil API classification GL-5 SAE 90 Genuine Gear Oil Part No. 8149630EX	Gr27
Front axle housing gear oil replacement <FG model only>			Every 60,000 km/36,000 miles or 24 months					Gear oil API classification GL-5 Below 40°C {104°F} SAE 90 Over 40°C {104°F} SAE 140 Use SAE 140 when operating vehicle at high load, such as continuous ascent on slopes and when the outside temperature is 10°C {50°F} or more	Gr26B
Hub bearing grease replacement			Every 60,000 km/36,000 miles or 12 months					Wheel bearing grease [NLGI No. 2 (Li soap)]	Gr26A, 27
Front axle birfield joint grease replacement <FG model only>					×			Wheel bearing grease [NLGI No. 2 (Li soap)]	Gr26B
Front axle kingpin bearing grease replacement <FG model only>					×			Wheel bearing grease [NLGI No. 2 (Li soap)]	Gr26B
Front axle steering knuckle grease replacement <FG model only>					×			Wheel bearing grease [NLGI No. 2 (Li soap)]	Gr26B
Brake reservoir tank fluid level	×							Brake fluid <SAE J1703f or FMVSS No. 116 DOT3>	Gr35
Brake fluid replacement			Every 24 months						
Power steering fluid replacement			Every 30,000 km/18,000 miles or 12 months					Automatic transmission fluid <DEXRON II or DEXRON III type>	Gr37

https://truckmanualshub.com/

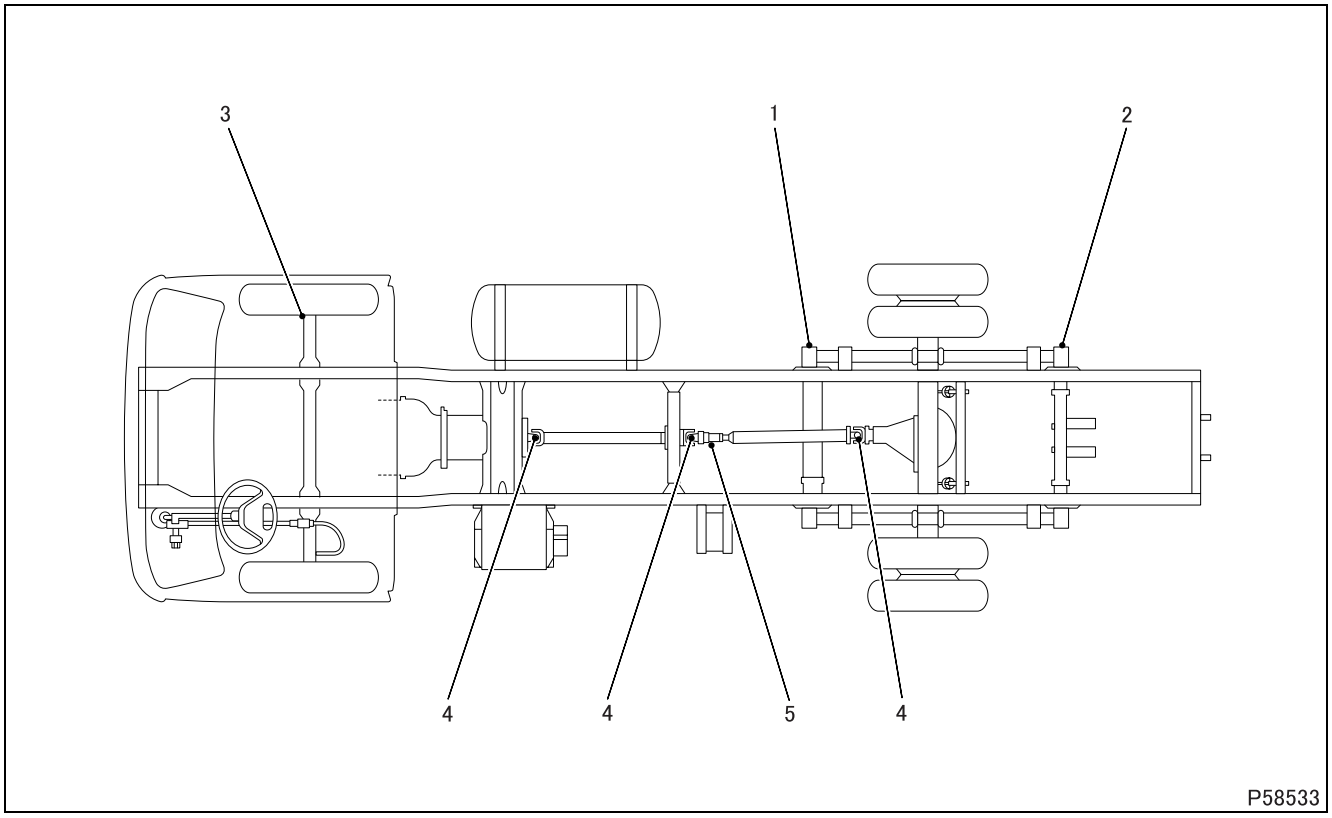
Items		Time of inspection and maintenance							Lubricant specifications	Reference Gr
		Pre-operational checks	1st maintenance at 4,000 km/2,500 miles	Inspection interval: Every 10,000 km/6,000 miles	Every 20,000 km/12,000 miles	Every 30,000 km/18,000 miles	Every 40,000 km/24,000 miles	Every 50,000 km/30,000 miles		
Lubrication of propeller shaft	Center bearing			Every 60,000 km/36,000 miles or 24 months					Bearing grease [NLGI No. 3 (Li soap)]	Gr25
	Universal joint, slip joint		×	Every 30,000 km/18,000 miles or 12 months					Wheel bearing grease [NLGI No. 2 (Li soap)]	See later section.
	Double Cardan joint <FG model only>			×						
Lubrication of rear suspension spring pin				Every 30,000 km/18,000 miles or 12 months					Chassis grease [NLGI No. 1 (Li soap)]	See later section.
Lubrication of kingpins				Every 30,000 km/18,000 miles or 12 months					Wheel bearing grease [NLGI No. 2 (Li soap)]	See later section.
Lubrication of door hinge				Every 30,000 km/18,000 miles or 12 months					Chassis grease [NLGI No. 1 (Li soap)]	Gr43
Lubrication of anchor hook <Except crew cab>				Every 30,000 km/18,000 miles or 12 months					Chassis grease [NLGI No. 1 (Li soap)]	Gr42

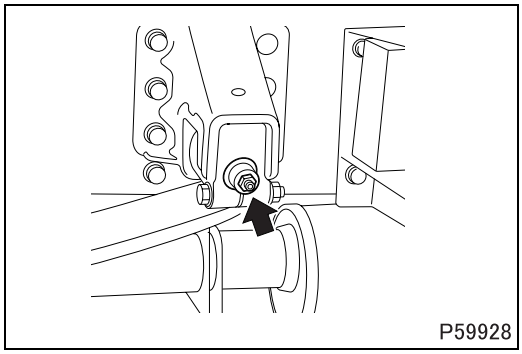
https://truckmanualshub.com/

Greasing Various Areas of Chassis

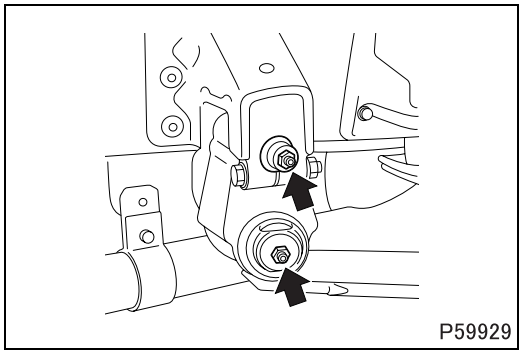
Carefully clean away all dust and dirt from the grease nipples, and use the specified type of grease. The areas to be greased are shown in the following illustration.

<FE>



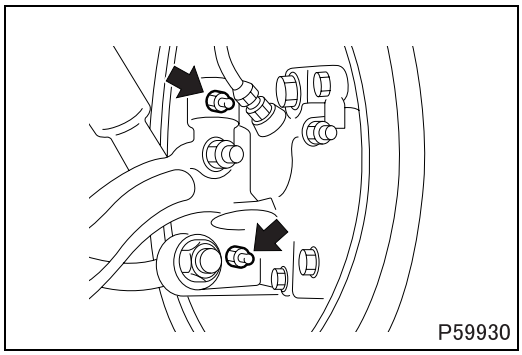


1. Rear spring pin front (left and right, 2 points)

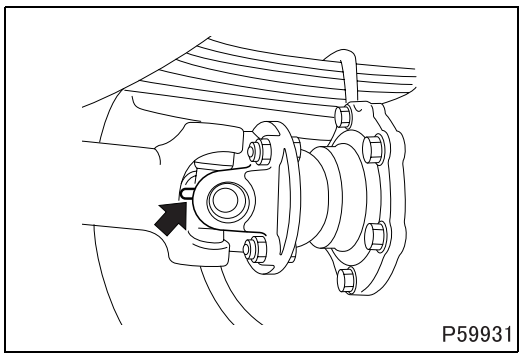


2. Rear spring pin rear (left and right, 4 points)

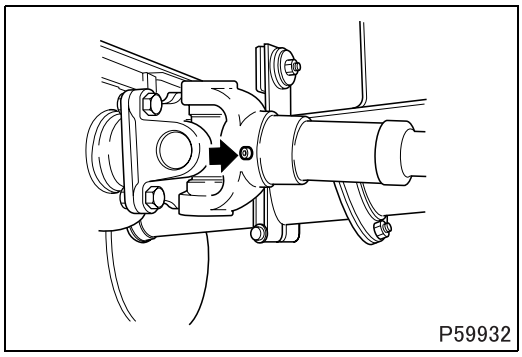
https://truckmanualshub.com/



3. Kingpin bearing (left and right, 4 points)



4. Propeller shaft universal joint's-all



5. Propeller shaft slip joint

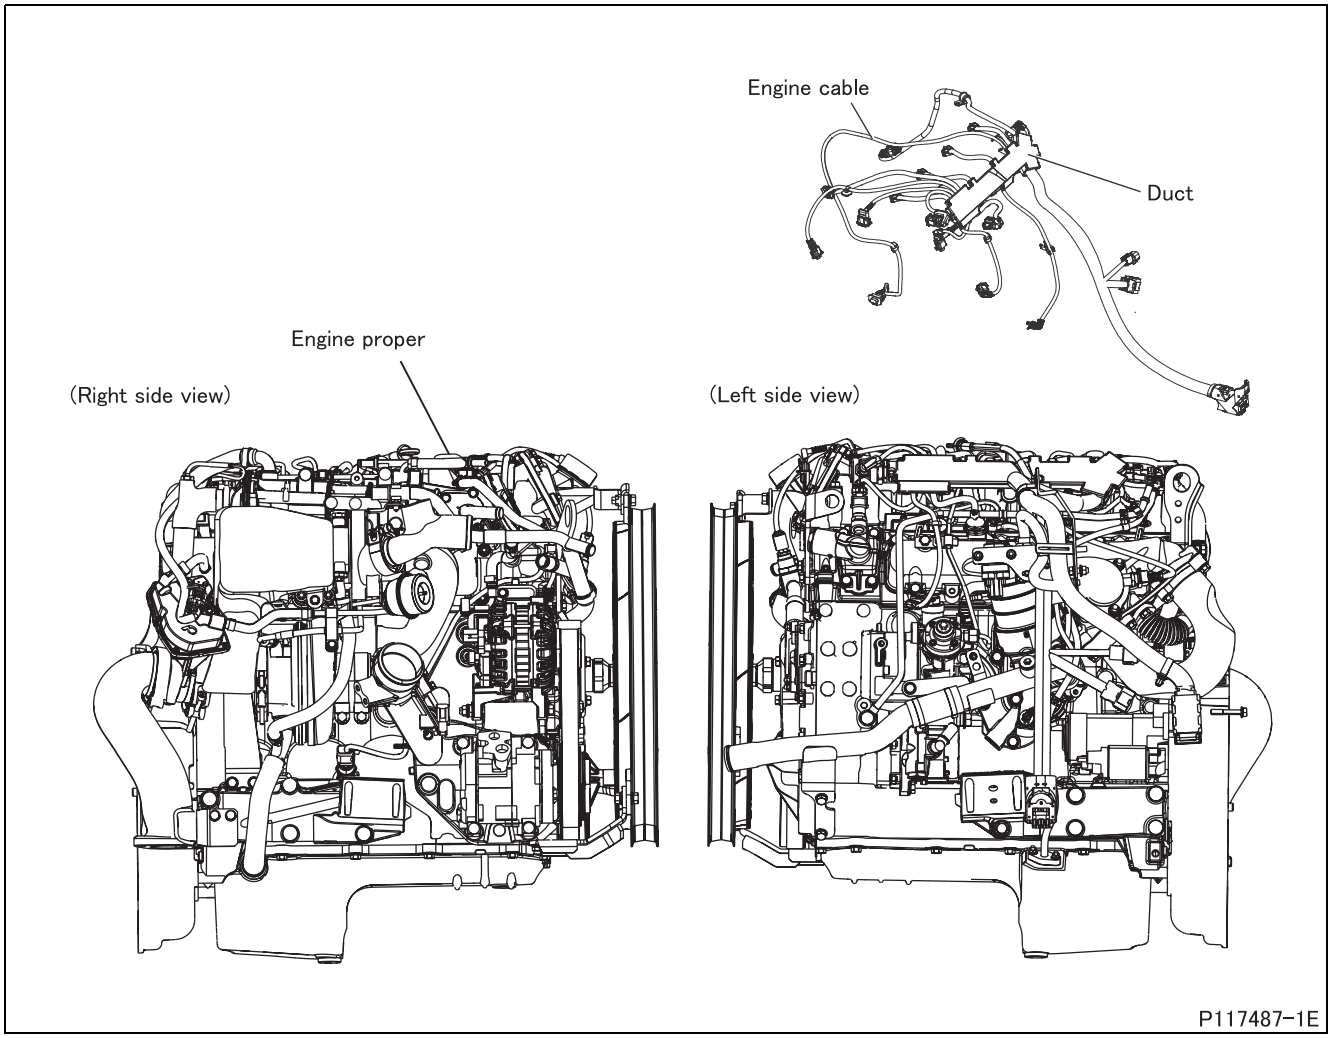
SPECIFICATIONS

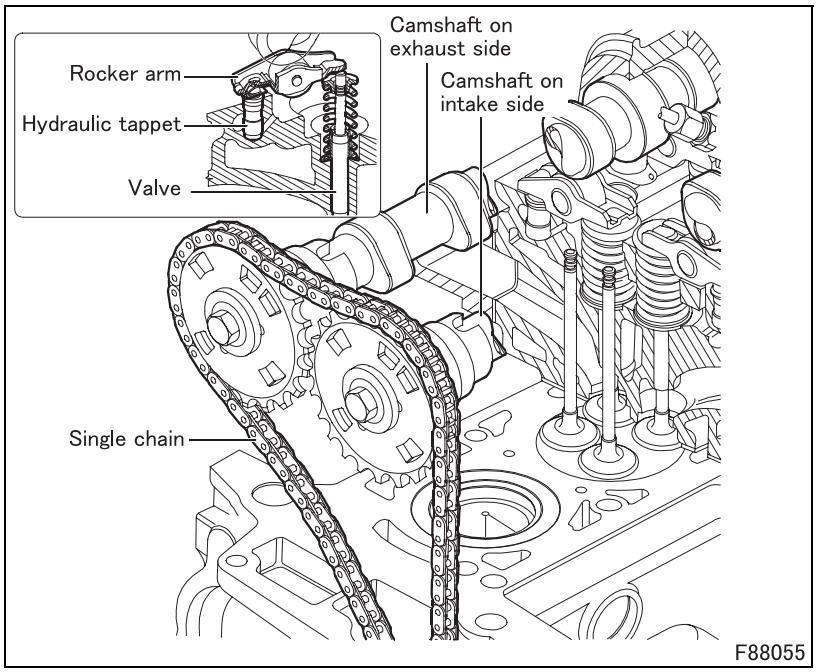
Item		Specifications
Engine model		4P10T5
Type		4-cylinder, in-line, water-cooled, 4-cycle diesel engine
Combustion chamber		Direct injection type
Valve mechanism		Double overhead camshaft (DOHC)
Maximum output	HP / rpm	120 / 2865 to 3400
Maximum torque	ft.lbf / rpm	400 / 1300 to 2865
Bore × stroke	mm {in.}	ϕ95.8 × 104 {ϕ3.77 × 4.09}
Total displacement	L {qts}	2.998 {3.2}
Compression ratio		17.5

https://truckmanualshub.com/

1. Engine Proper



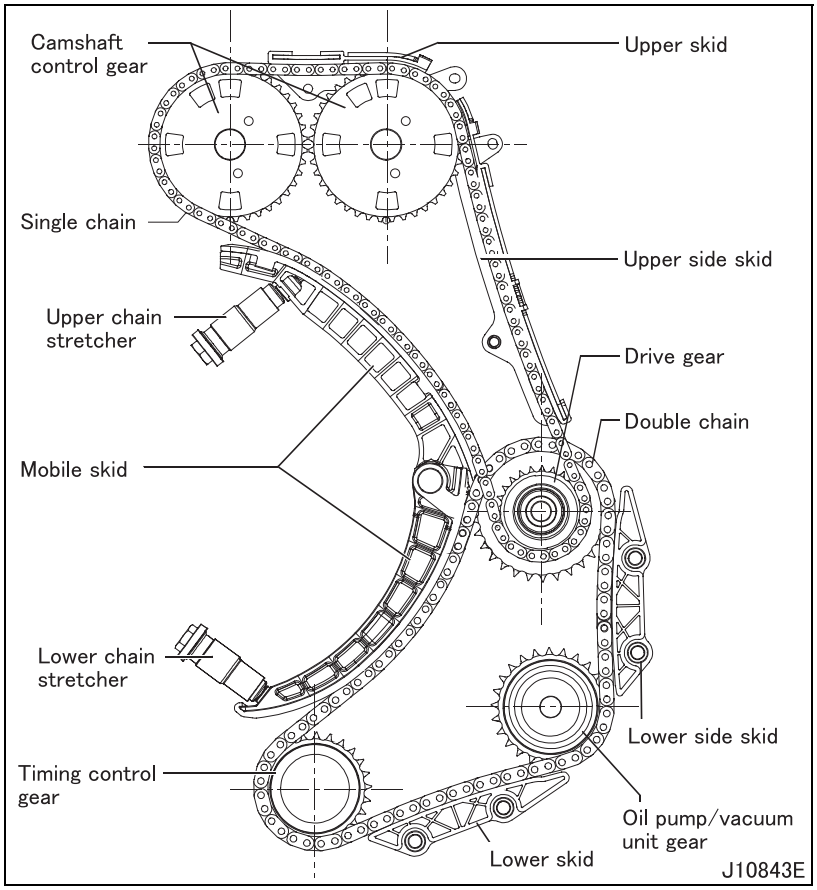
2. Timing System



- The timing system is the type with a twin camshaft in the head and four valves per cylinder with hydraulic tappets.
- The control is transmitted by two chains.
  - A double chain by 3/8” is set in motion by the driving shaft and sets the control shafts in motion: oil pump/ vacuum pump - high pressure pump.
  - A single chain is set in motion by the high pressure control shaft gear and sets the camshafts in motion.
- The rocker arms, one for the valve, are kept in contact with the corresponding cam by an hydraulic tappet, thus eliminating the need for regular adjustments.

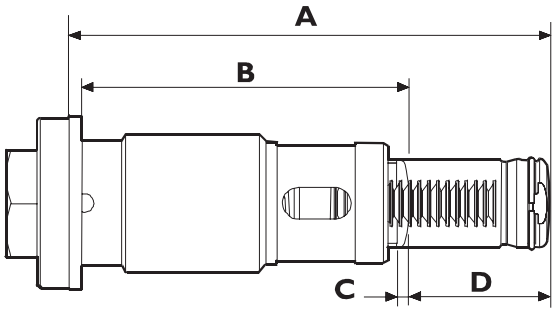
https://truckmanualshub.com/

2.1 Timing system and auxiliary system diagram



- Replace both chains even if an abnormality occurs in only one chain. When replacing the chains, it is also necessary to replace the oil pump/vacuum unit gear, the drive gear, each skid (upper, upper side, lower side, and lower), the camshaft control gear and the chain stretcher.
- Replace the chain stretcher with anti-return device each time you disassemble the timing system. Once the lock of the main body opens and the piston is thrust outward, the chain stretcher can no longer be reinstalled in its original position.

2.2 Hydraulic chain stretcher upper

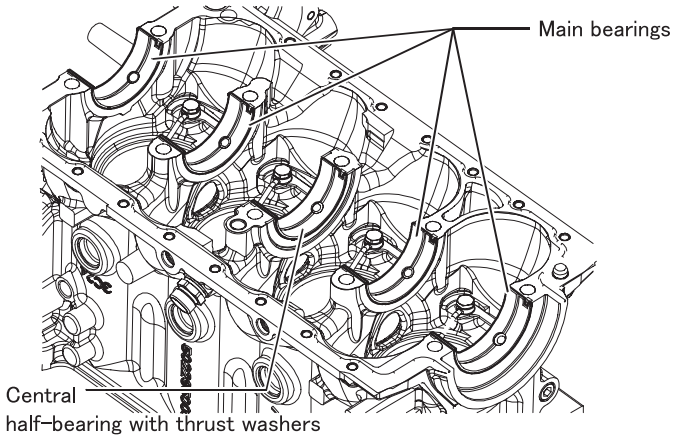


A : Max. range 76.9±0.4 mm{3.03±0.016 in.}
B : Piston engaged 53.6 mm{2.11 in.}
C : Min. travel for piston disengagement 2.3 mm{0.091 in.}
D : Working travel 24.5 mm{0.96 in.}

N130208

https://truckmanualshub.com/

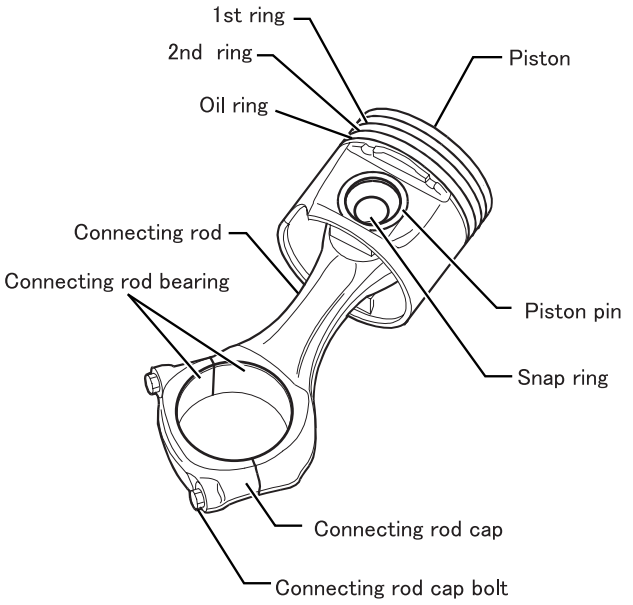
3. Main Bearing



F5092−1

- Undersize main bearings are provided as spare parts.
- A thrust plate is installed on the central half-bearing.
- The pilot hole in bulkhead of #5 position is larger than the pilot holes in bulkheads of #1 to #4 positions. (#1 to #4 positions are the same size.)

4. Connecting Rod, Piston

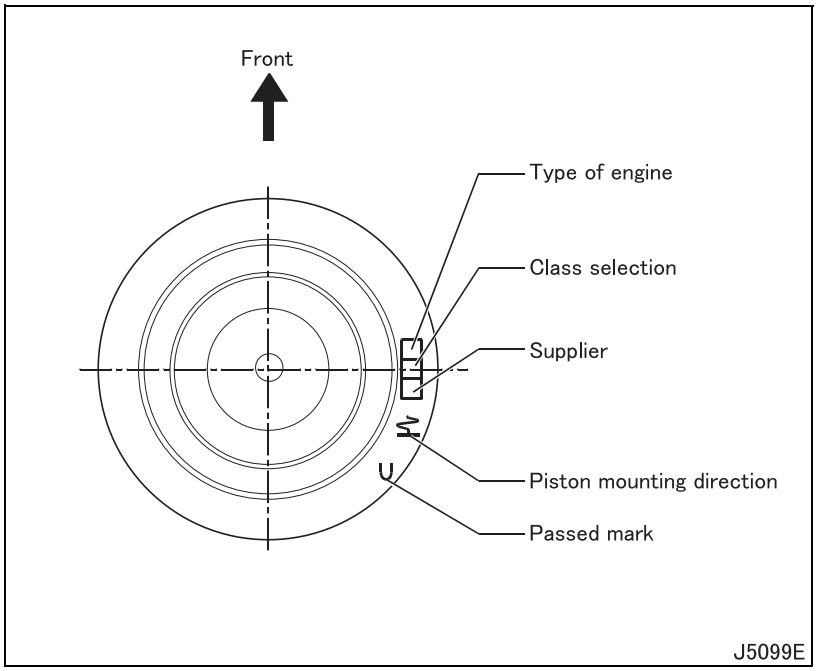


J5087−1E

- A replacement piston is supplied with piston rings, the piston pin and the snap ring.

https://truckmanualshub.com/

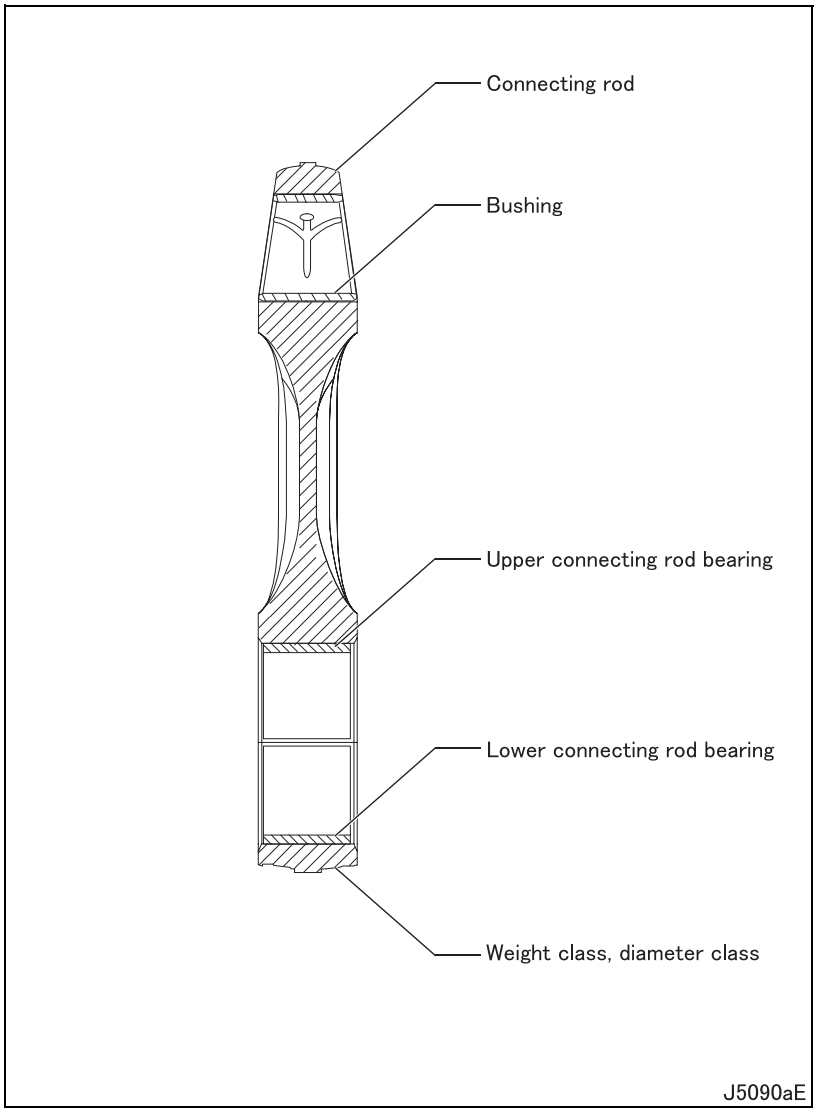
4.1 Piston



- Etched on the top of the piston are the following.
  - The type of engine.
  - Class selection and supplier.
  - Piston mounting direction.
  - Passed mark: “Test passed” symbol.

https://truckmanualshub.com/

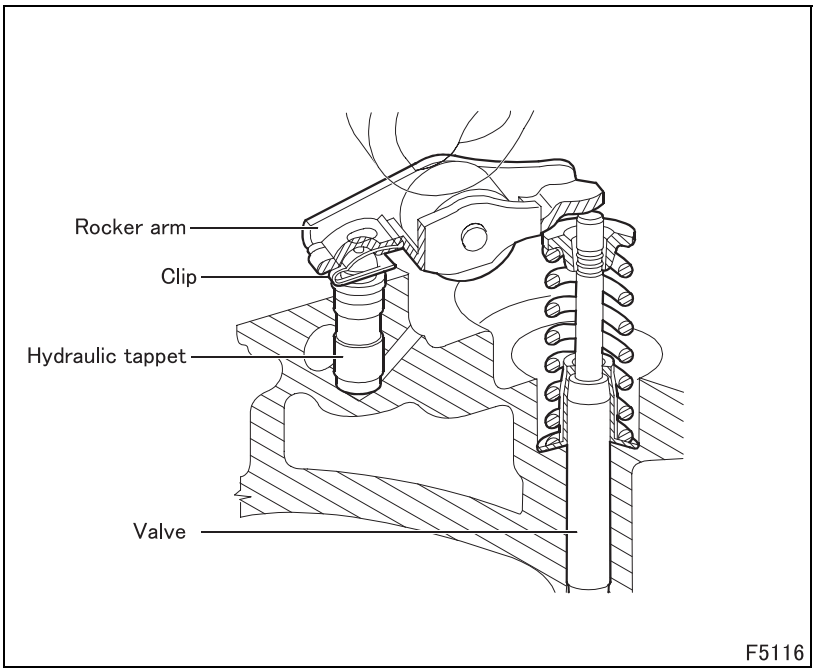
4.2 Connecting rod



- Each connecting rod has its cap marked with the following.
  - A number indicating the weight class of the connecting rod mounted in production.
  - A letter: O or X indicating the diameter class of the big end mounted in production.

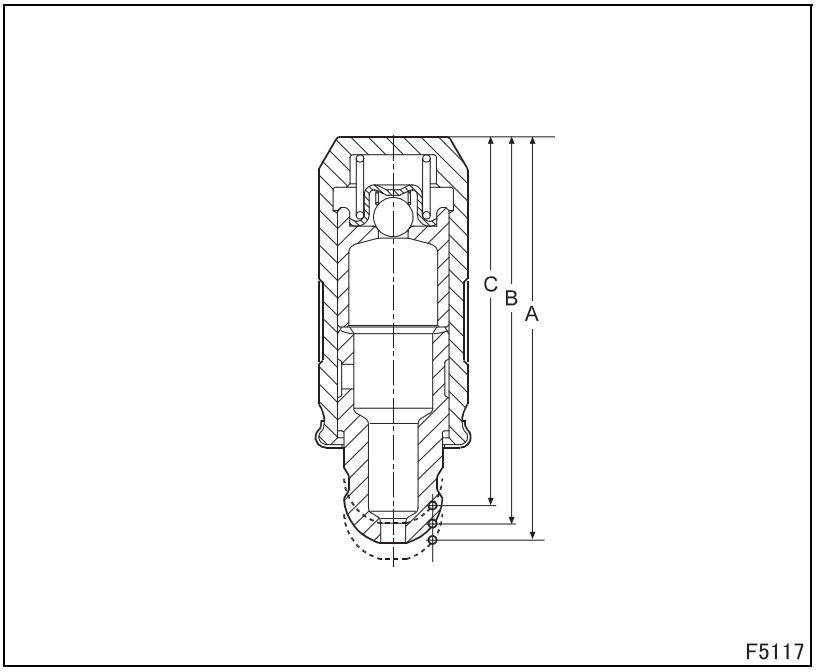
https://truckmanualshub.com/

5. Rocker Arms, Tappets



- The rocker arm assembly is composed of the rocker arm, hydraulic tappet, made integral with each other by the clip.

5.1 Cross section of the hydraulic tappet



- A = 32.44 mm ± 0.3 mm {1.28 in. ± 0.012 in.}, end of stroke
- B = 31.30 mm {1.23 in.}, working position
- C = 29.75 mm ± 0.25 mm {1.17 in. ± 0.0098 in.}, start of stroke

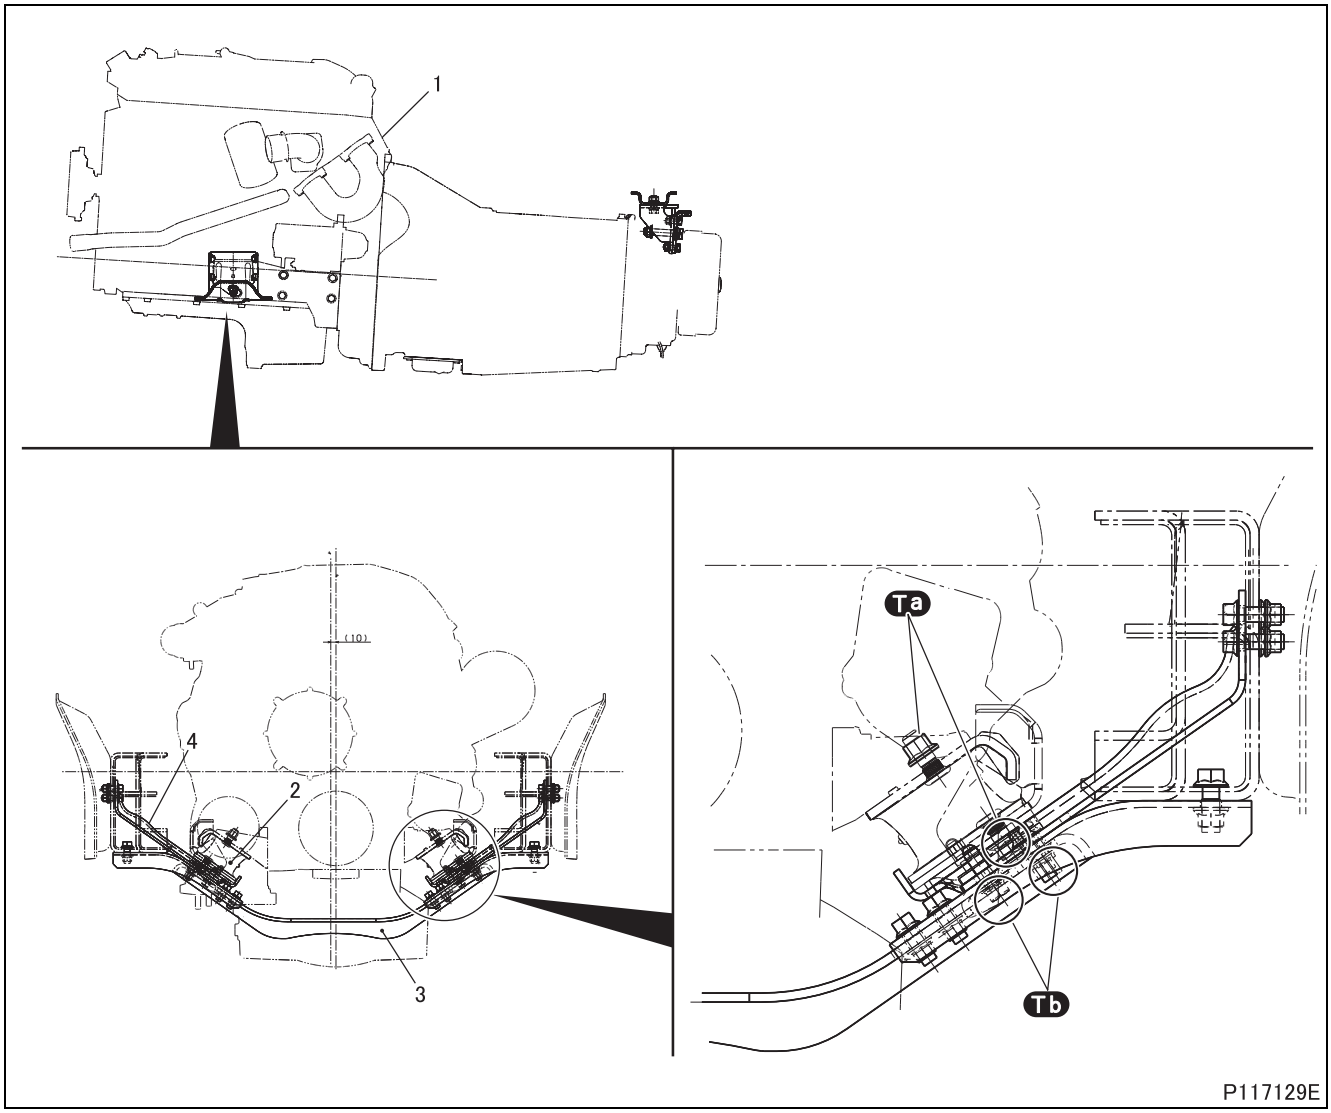
ENGINE REMOVAL AND INSTALLATION <TILT CAB>



● **Removal sequence**

1 Engine
2 Cushion rubber
3 Engine mounting support cross member
4 Engine mounting support bracket

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION ⚠

- **When lifting the engine, make sure that the engine does not strike the cab and the rear body.**
- **Only use hoisting equipment appropriate for the engine weight (approximately 350 kg {770 lb}).**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

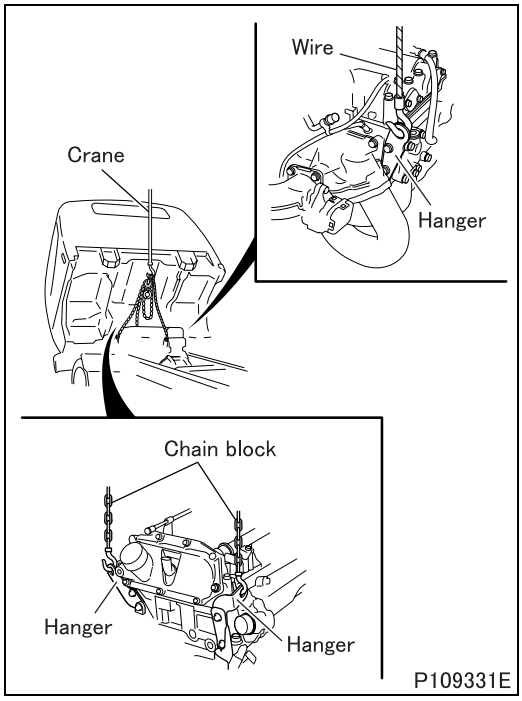
Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Nut (cushion rubber installation)	Two wheel drive	76.5 {56, 7.8}	–
		Four wheel drive	115 {85, 12}	
Tb	Bolt (engine mounting support bracket installation)		58.7 {43, 6.0}	–

https://truckmanualshub.com/

◆Removal procedure◆

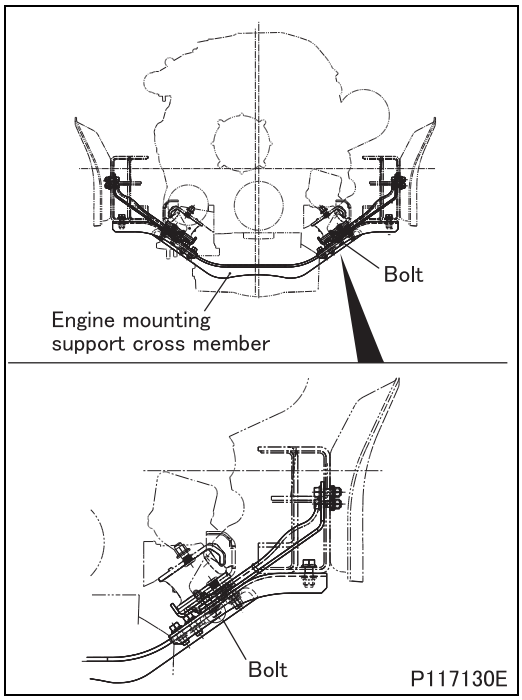
■ Work before removal

- Remove the transmission. (See Gr22.)
- Drain off the cooling water. (See Gr14.)
- Remove the wiring, pipes and related parts in the vicinity of the engine.
- Remove the rear mounting bridge. (See Gr42.)



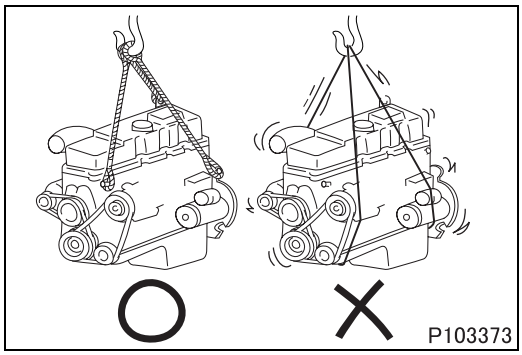
■ Removal: Engine

- Connect the wires to the chain block and onto the three hangers on the engine and lift the engine with a crane until they are tight.
- Support the transmission with a transmission jack.
- Check that all wiring and piping have been disconnected from the engine.



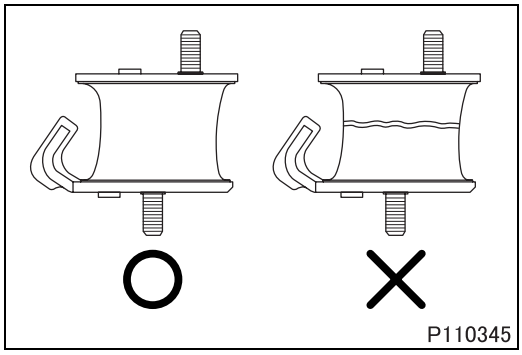
- Remove the bolts shown in the drawing from the bottom of the vehicle and separate the engine from the engine mounting support cross member.

https://truckmanualshub.com/



- Adjust the lifting angle of the engine as necessary in this step. Once the engine has cleared the rear of the cab, turn the engine 90 degrees clockwise so as to prevent it from hitting the frame and cab, then lower it to the right side of the vehicle.

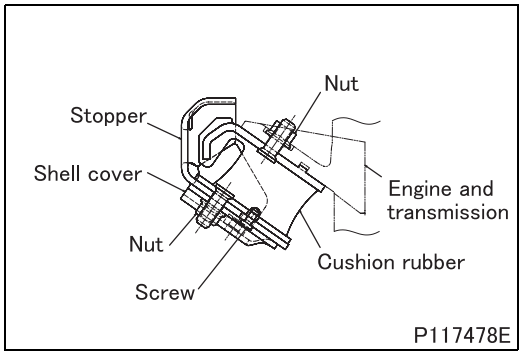
◆Inspection procedure◆



■ Inspection: Cushion rubber

- Check the entire periphery of the cushion rubber for cracks, breakage, oil stains or any other defect.
- Replace the cushion rubber if it is defective.

◆Installation procedure◆

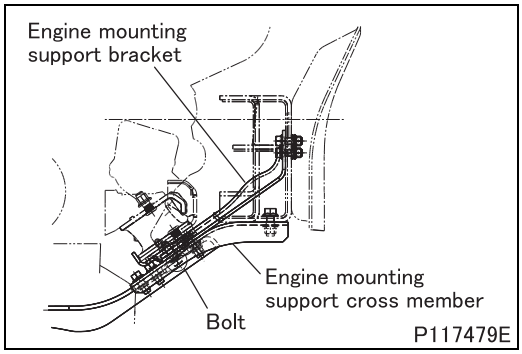


■ Installation: Cushion rubber

- Install the stopper and the shell cover on the cushion rubber, and then install them on the engine.

■ Installation: Engine

- While finely adjusting the hoisting angle of the engine, install the engine taking care that it does not strike the frame or the cab.
- Install the engine on the engine mounting support cross member.



- Remove the wire and chain block from the engine hanger (3 points).

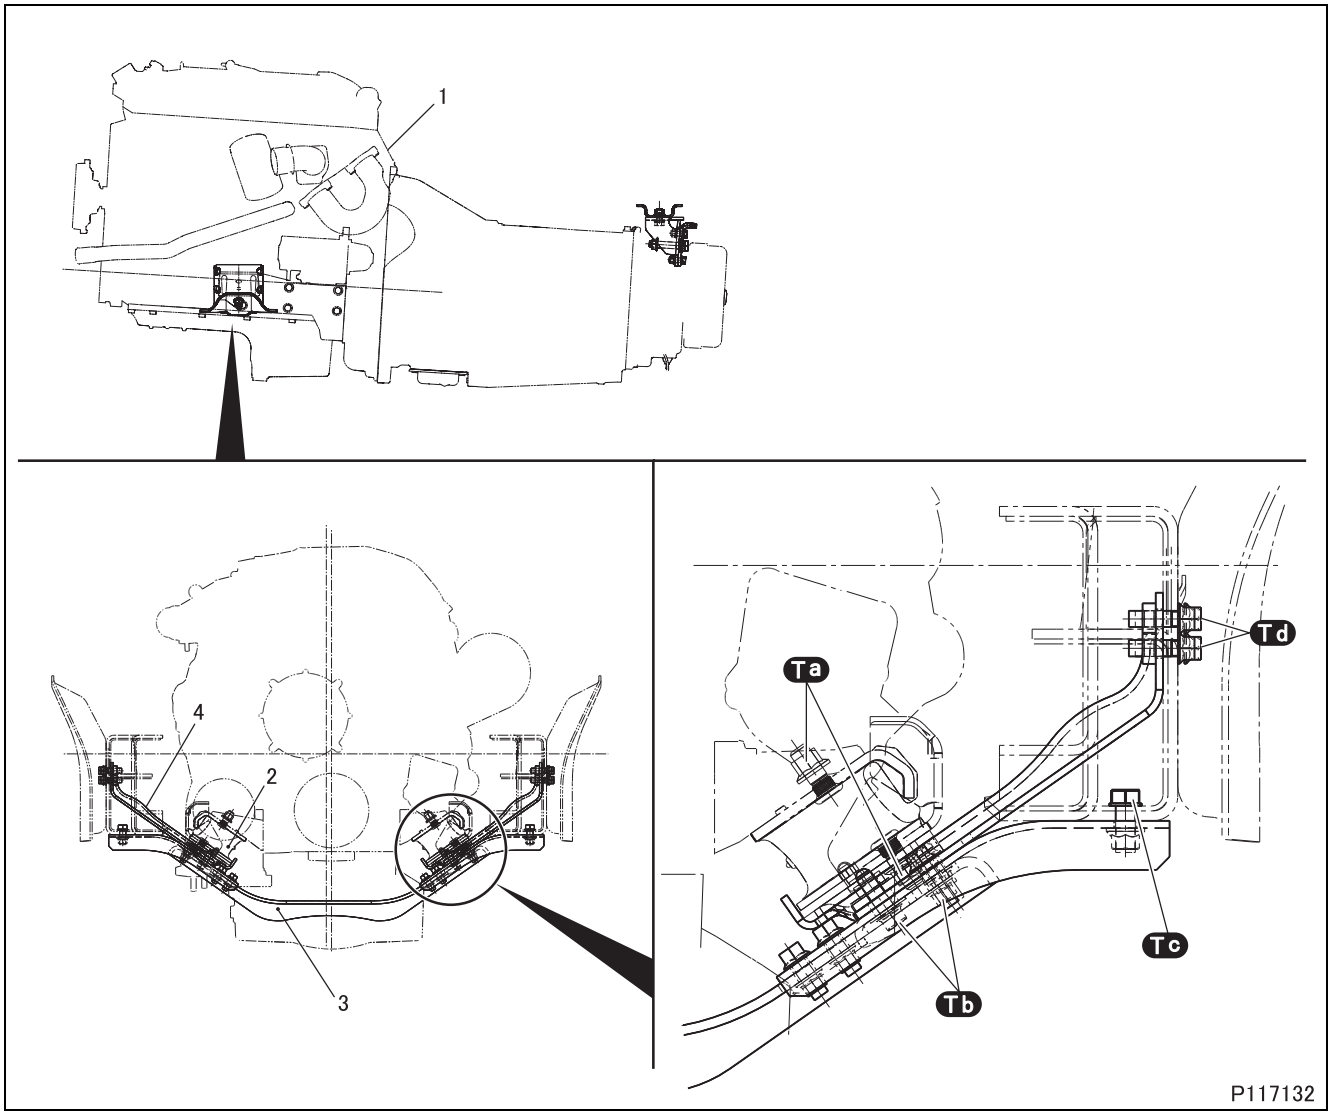
https://truckmanualshub.com/

■ **Work after installation**

- Install the transmission. (See Gr22.)
- Reinstall the wiring, pipes and related parts in the vicinity of the engine.
- Reinstall the rear mounting bridge. (See Gr42.)
- Replenish cooling water. (See Gr14.)

https://truckmanualshub.com/

ENGINE REMOVAL AND INSTALLATION <FIXED CAB>



● **Removal sequence**

1 Engine
2 Cushion rubber
3 Engine mounting support cross member
4 Engine mounting support bracket

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION ⚠

- **When removing and installing the engine, make sure that the engine does not strike the cab and the rear body.**
- **Secure the engine with the engine jack before removing each part.**

https://truckmanualshub.com/

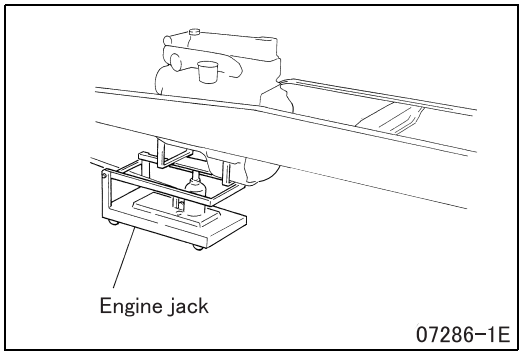
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (cushion rubber installation)	76.5 {56, 7.8}	–
Tb	Bolt (engine mounting support bracket installation)	58.7 {43, 6.0}	–
Tc	Bolt (engine mounting support cross member installation)	106 {78, 11}	–
Td	Bolt (engine mounting support bracket installation)	81.4 {60, 8.3}	–

◆Removal procedure◆

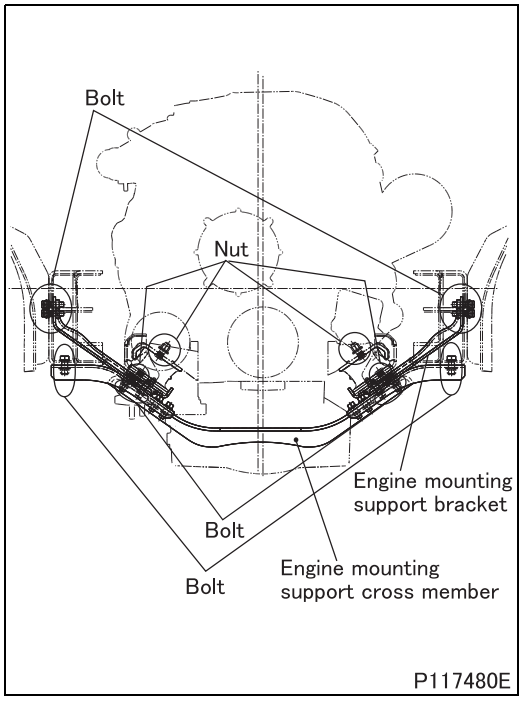
■ Work before removal

- Jack up the vehicle. (See Gr00.)
- Remove the transmission. (See Gr22.)
- Remove the front axle. (See Gr26.)
- Drain off the cooling water. (See Gr14.)
- Remove the wiring, pipes and related parts in the vicinity of the engine.



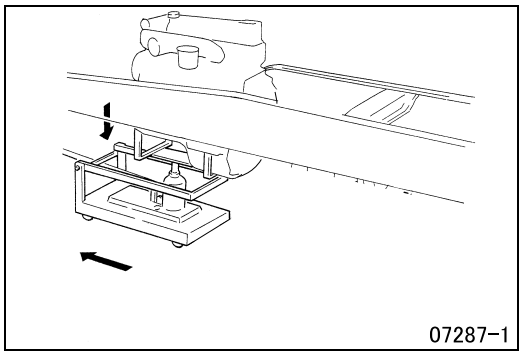
■ Removal: Engine

- Support the engine with an engine jack.
- Check that all wiring and piping are completely disconnected from the engine.



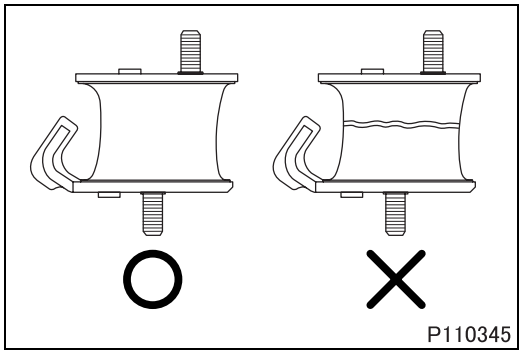
- For the rigid leaf type, separate the engine from different parts, while adjusting its lift amount (jack-up height), and remove the engine mounting support bracket from the engine compartment.

https://truckmanualshub.com/



- While keeping the engine level, fully lower the engine.
- Lift the vehicle with a jack and move the engine forward.

◆Inspection procedure◆



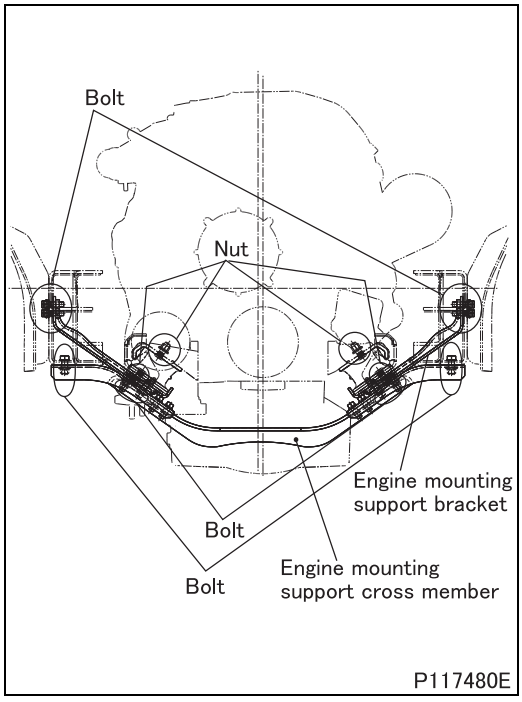
■ Inspection: Cushion rubber

- Check the entire periphery of the cushion rubber for cracks, breakage, oil stains or any other defect.
- Replace the cushion rubber if it is defective.

◆Installation procedure◆

■ Installation: Cushion rubber

- Support the engine with the engine lifter.
- While maintaining the engine horizontal, move the cushion rubber to the bottom of the frame, and then slowly raise the engine.
- While adjusting the lift of the engine (jacked-up height), install the nuts and bolts.



- Remove the engine lifter.

https://truckmanualshub.com/

■ **Work after installation**

- Install the transmission. (See Gr22.)
- Install the front axle. (See Gr26.)
- Install the wiring, pipes and related parts in the vicinity of the engine.
- Jack down the vehicle. (See Gr00.)
- Replenish the cooling water. (See Gr14.)

https://truckmanualshub.com/

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks

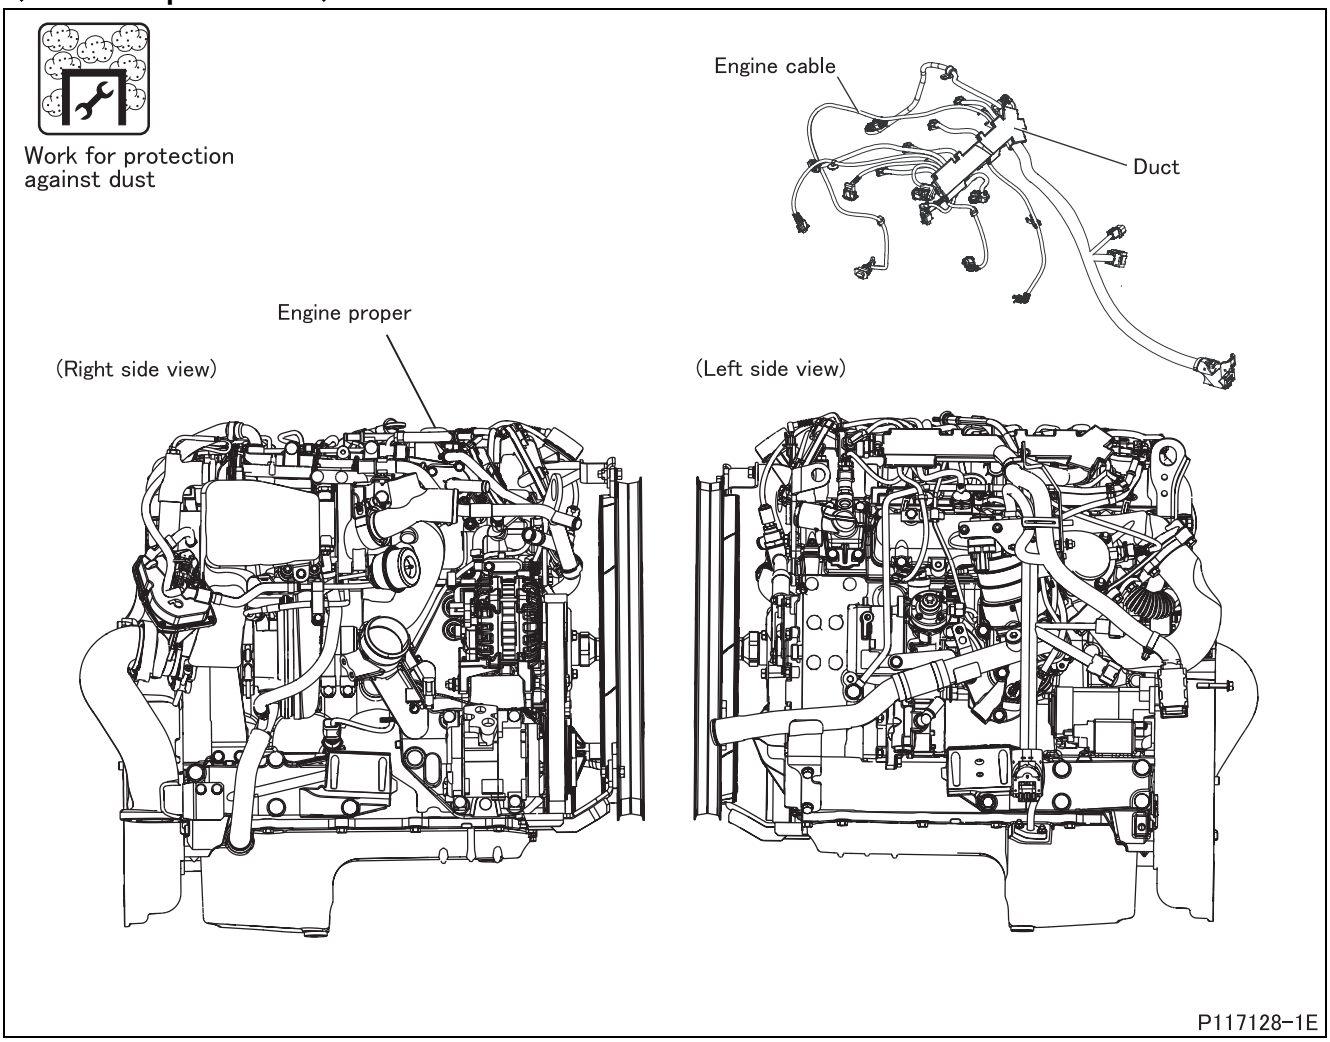
WORK FOR OVERHAULING ENGINE

◆Removal procedure◆



: This work requires protection against dust.

- If fine dust enters the high pressure fuel pump, engine performance will significantly be affected. Be sure to cover the openings after removing parts such as pipes.

■ Removal: Engine cable, duct, starter

- To be able to fit the ca for the cb to the crankcase, it is necessary to carry out some preliminary operations as described below.
- Remove the engine cable together with the duct, disconnecting the electrical connections from the following parts.
  - Blow-by pressure sensors.
  - EBS (Exhaust Brake System) valve.
  - Glow plugs.
  - Injectors.
  - EGR (Exhaust Gas Recirculation) cooler outlet temperature sensor.
  - EGR (Exhaust Gas Recirculation) actuator.
  - Pressure sensor.
  - VGT (Variable Geometry Turbocharger) actuator.

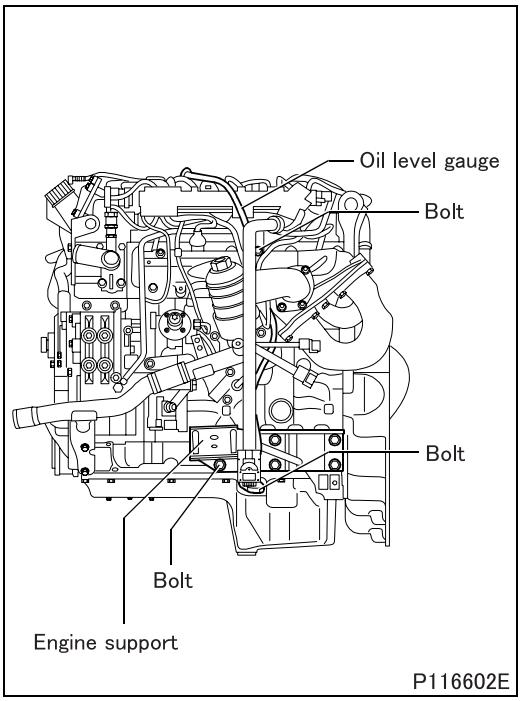
https://truckmanualshub.com/

- Pressure regulation valve.
- Boost pressure and temperature sensor.
- Water temperature sensor.
- Camshaft timing sensor.
- Engine speed sensor.
- Oil pressure sensor.

• Remove the starter motor.

NOTE

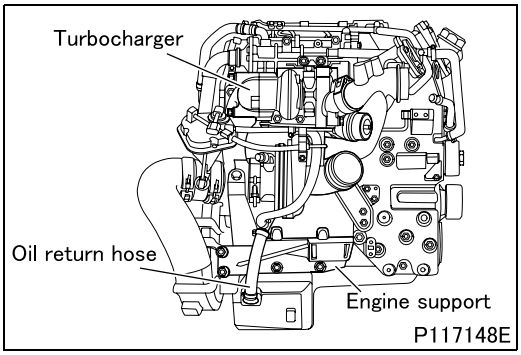
- **Block the turbocharger air/exhaust gas inlets and outlets to prevent the entry of foreign material.**



■ Working from the left-hand side

• Remove the pipe for checking the oil level. Unscrew and remove the screw fastening the pipe to the intake manifold; unscrew and remove the screws fastening the pipe to the oil pan.

• Remove the engine support.



■ Working from the right-hand side

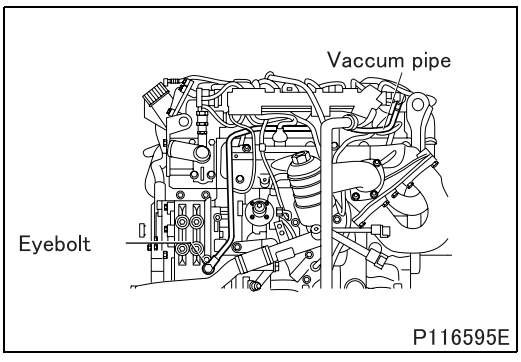
• Remove the turbocharger protector.

• Remove the oil return pipe from the turbocharger.

• Remove the fixing screws and remove the engine support.

• Fit the [a] to the crankcase and use these to secure the engine to the [b].

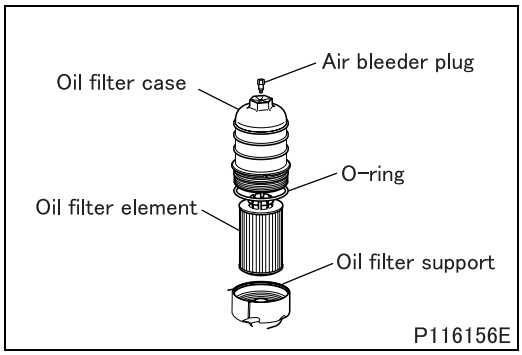
• Drain the oil from the engine by removing the plug from the oil pan.



■ Removal: Vacuum pipe

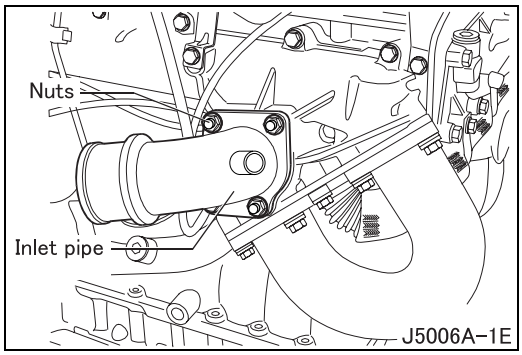
• Remove the eyebolt, and remove the vacuum pipe.

https://truckmanualshub.com/



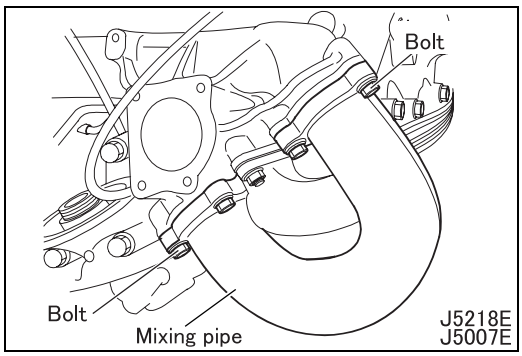
■ **Removal: Oil filter case, oil filter element**

- Loosen the oil filter case (by approx. 2.5 turns).
- Remove the air bleeder plug.
- Remove the oil filter case.
- Remove the oil filter element and O-ring.



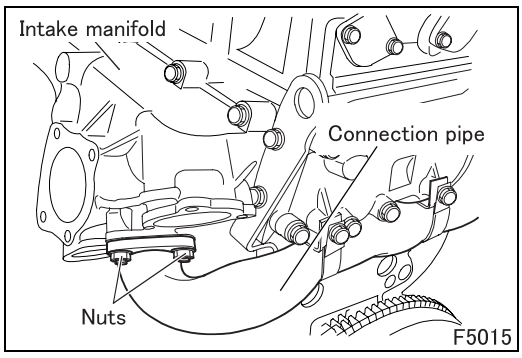
■ **Removal: Air inlet pipe**

- Remove the nuts and detach the air inlet pipe.



■ **Removal: Mixing pipe**

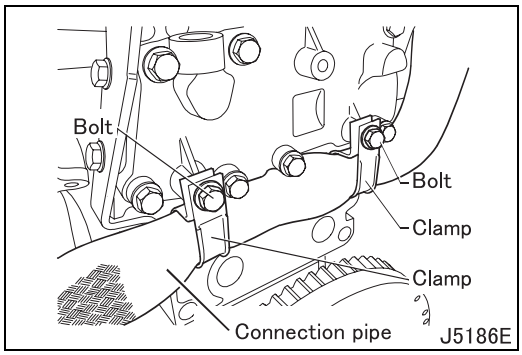
- Remove the mixing pipe.



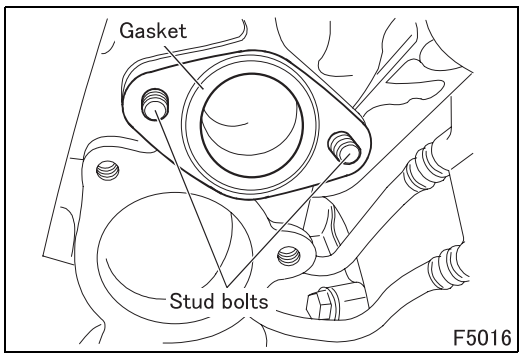
■ **Removal: Connection pipe**

- Remove the two nuts; disconnect the pipe from the intake manifold.

https://truckmanualshub.com/

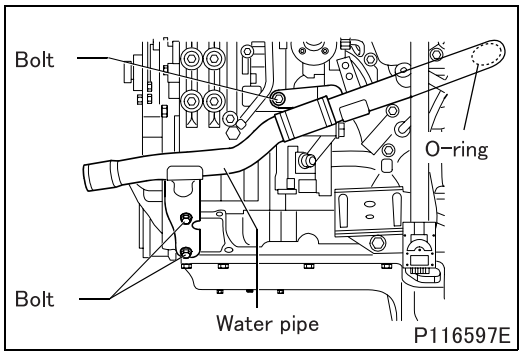


- Remove the clamps from the connection pipe.



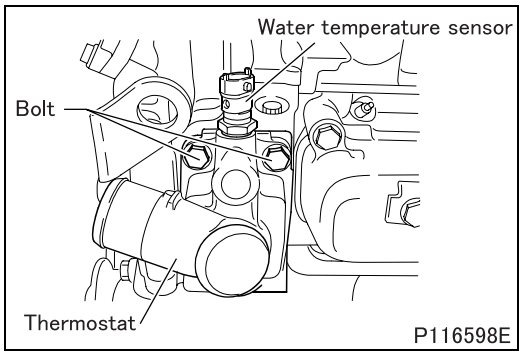
■ **Removal: Gasket, stud bolt**

- Remove the gasket.
- Remove the stud bolts.



■ **Removal: Water pipe**

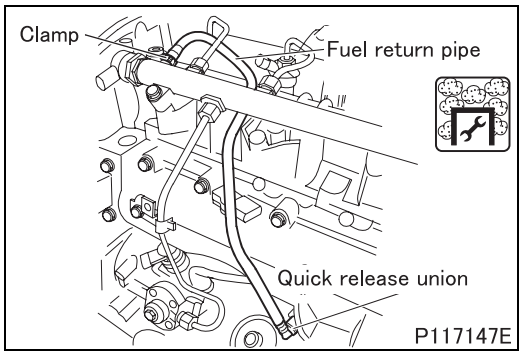
- Remove the water pipe from the oil cooler.



■ **Removal: Thermostat, water temperature sensors**

- Remove the thermostat and the water temperature sensor.

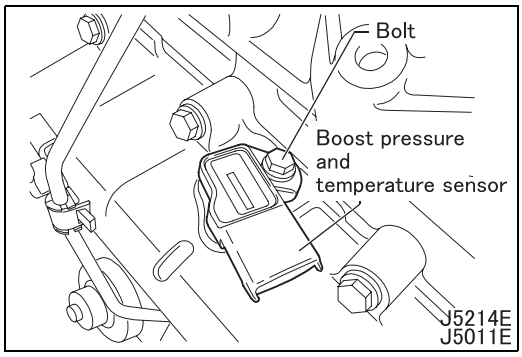
https://truckmanualshub.com/



■ **Removal: Fuel return pipe**

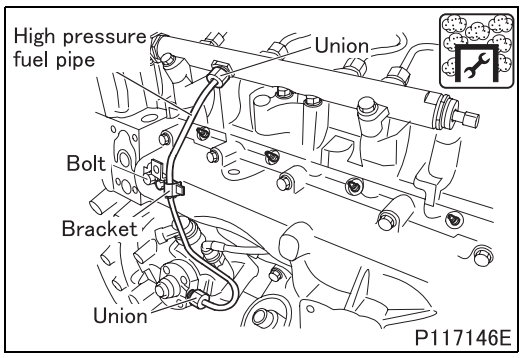
: This work requires protection against dust.

- Remove the clamp fastening the fuel return pipe to the common rail.
- Open the quick release union and remove the fuel return pipe for fuel return from the common rail.



■ **Removal: Boost pressure and temperature sensor**

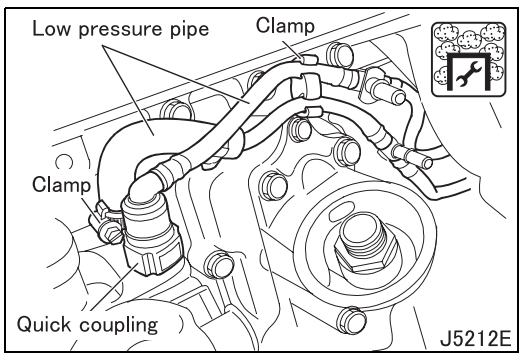
- Remove the boost pressure and temperature sensor from the intake manifold.



■ **Removal: High pressure fuel pipe**

: This work requires protection against dust.

- Loosen the bolts of the pipe retaining bracket and remove the high pressure fuel pipe.

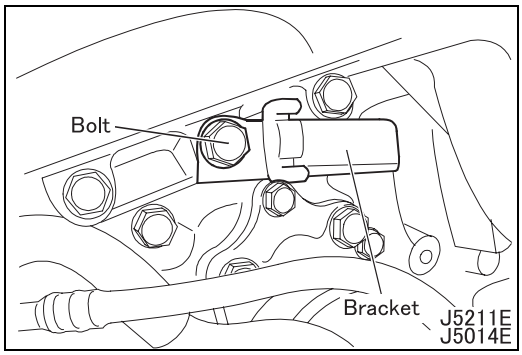


■ **Removal: Low pressure pipe**

: This work requires protection against dust.

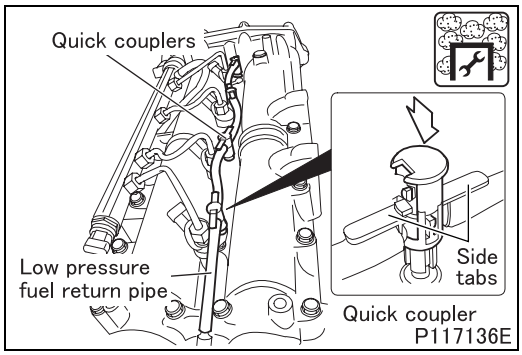
- Remove the connectors on the injector side and the common rail side of the fuel pipe.
- Remove the common rail from the engine overhead.

https://truckmanualshub.com/



■ **Removal: Bracket**

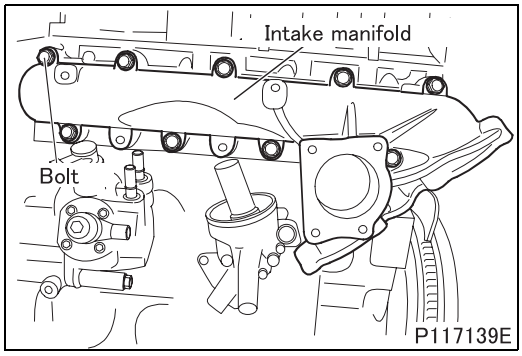
- Remove the bracket.



■ **Removal: Low pressure fuel return pipe**

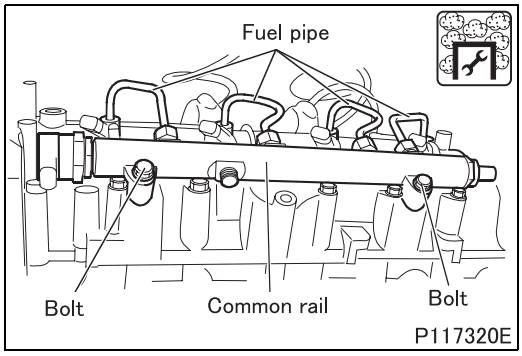
: This work requires protection against dust.

- To remove the low pressure fuel return pipe from the injectors it is necessary to open the quick couplers.
- To open the quick couplers press on the side tabs and raise the central body as shown in the figure.



■ **Removal: Intake manifold**

- Remove the intake manifold together with the gasket.

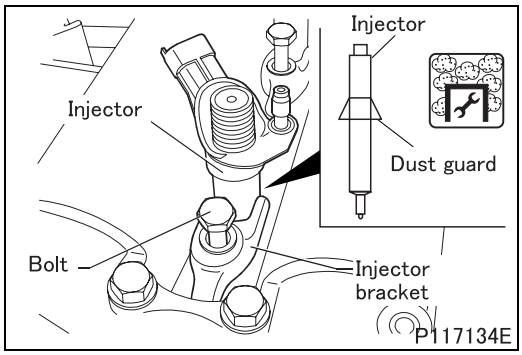


■ **Removal: Fuel pipe, common rail**

: This work requires protection against dust.

- Remove the injector side connectors using cf <Four wheel drive>.
- Remove the common rail side connectors using cd.
- Unscrew and remove the bolts. Detach the common rail from the engine overhead.

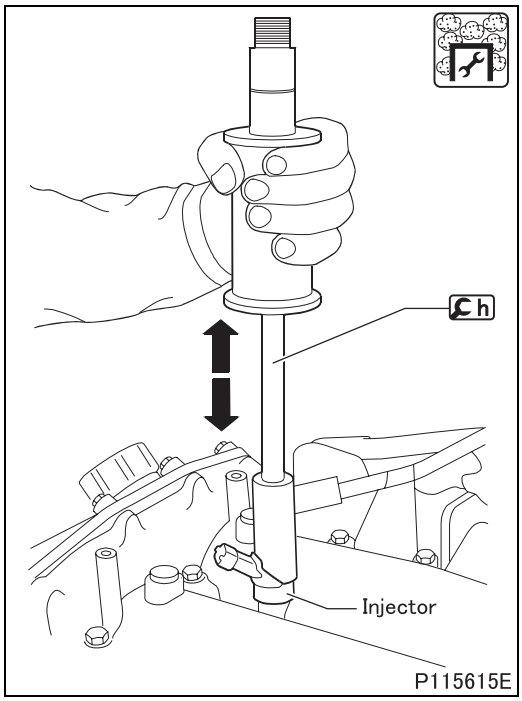
https://truckmanualshub.com/



■**Removal: Injector bracket**

: This work requires protection against dust.

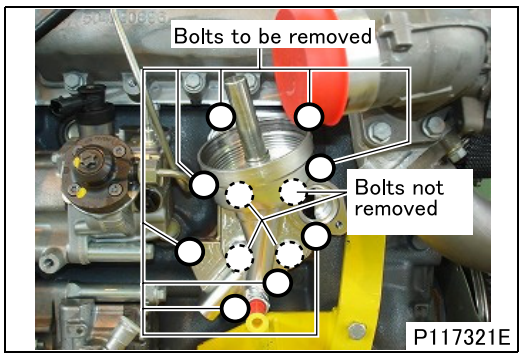
- Remove the injector bracket.



■**Removal: Injector**

: This work requires protection against dust.

- Remove the injector from the engine overhead using . (There is no gasket as the injector employs a direct sealing structure.)



■ **Removal: Oil cooler**

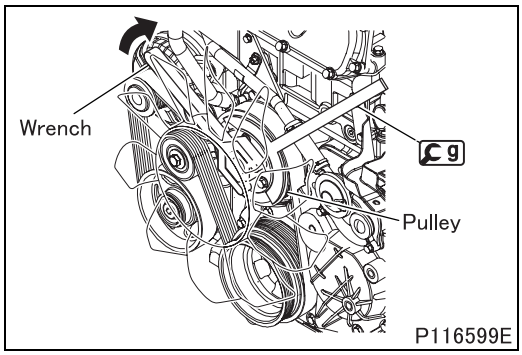
- Remove the screws and detach the oil cooler with its gasket.

CAUTION ⚠

- **Do not remove the four bolts inside the oil filter support. If you remove these bolts, the heat exchanger in the oil cooler will become loose, which will mix oil and water, posing a danger.**

- The crankcase does not have a drain plug for draining off the cooling water, so when you remove the crankcase the cooling water will flow out. In this case, rotate the engine until all of the cooling water remaining in the engine flows out.

https://truckmanualshub.com/

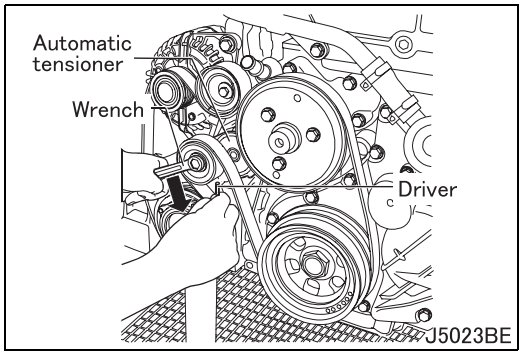


■ **Removal: Automatic cooling fan coupling, belt**

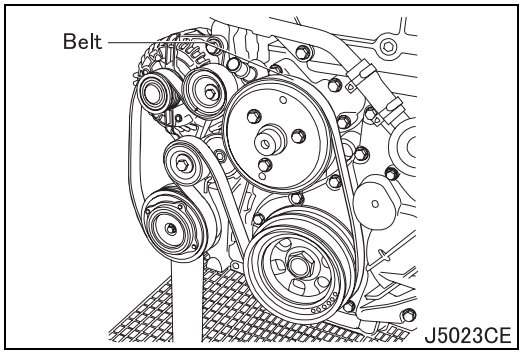
- Install g on the pulley, loosen the nut, and then remove the automatic cooling fan coupling.

CAUTION ⚠

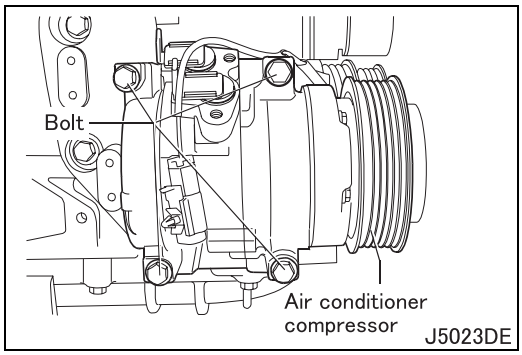
- **The automatic cooling fan coupling has left hand thread.**



- Using a wrench, by turning the automatic tensioner in the direction of the arrow so as to slacken the belt.
- Insert a screwdriver, or the like, into the hole in the automatic tensioner, and lock the automatic tensioner in the “Stop” position.



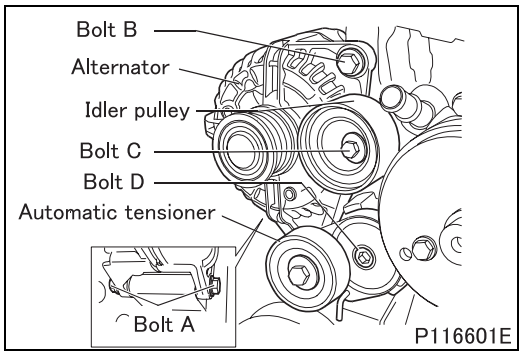
- Remove the belt.
- Remove the screwdriver that you inserted, from the automatic tensioner.



■ **Removal: Air conditioner compressor**

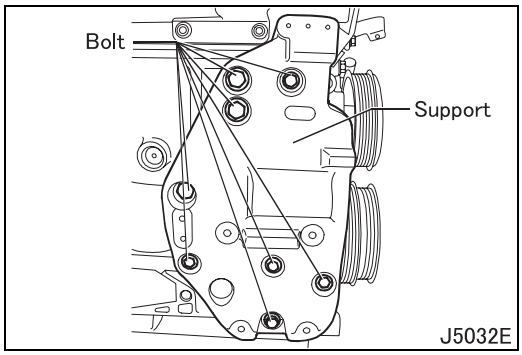
- Remove the air conditioner compressor.

https://truckmanualshub.com/



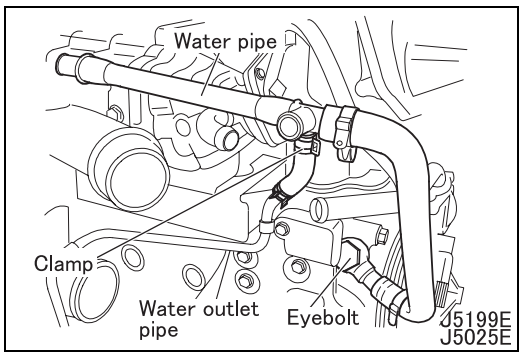
■ **Removal: Alternator, idler pulley, automatic tensioner**

- Loosen bolt C, and remove the idler pulley.
- Loosen bolt D, and remove the automatic tensioner.
- Remove through bolt A fixing the alternator.
- Remove bolt B, and then remove the alternator.



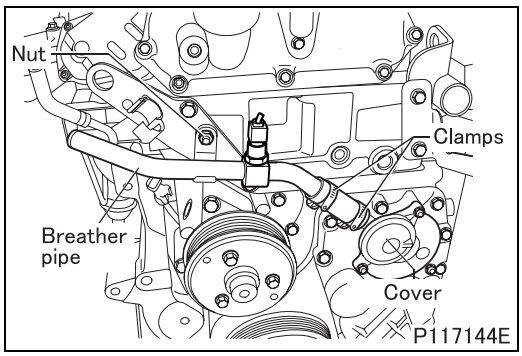
■ **Removal: Support**

- Remove the alternator support from the crankcase.



■ **Removal: Water pipe**

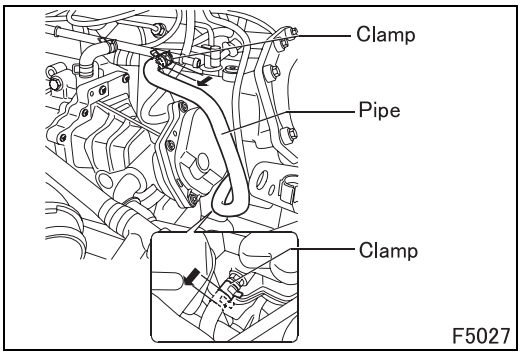
- Free the clamp on the water outlet pipe, and remove the water pipe.
- Remove the eyebolt together with the copper gasket.



■ **Removal: Breather pipe**

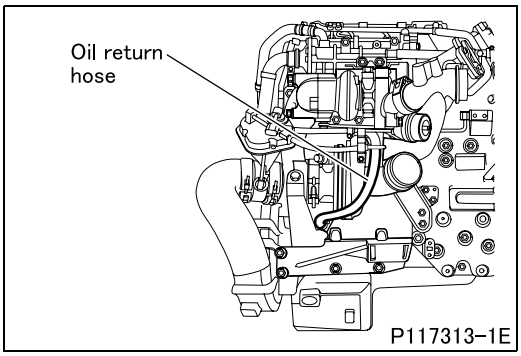
- Remove the breather pipe from the cover.

https://truckmanualshub.com/



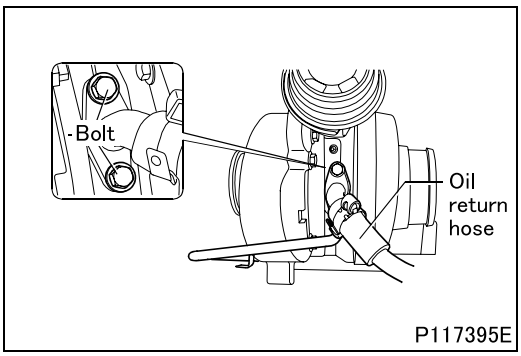
■ **Removal: Hose**

- Free the clamp, separate it from the position where it was fixing the hose, then move it in the direction of the arrow and remove the hose.



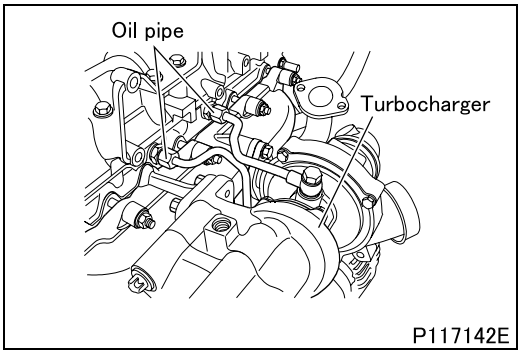
■ **Removal: Oil return hose**

- Disconnect the oil return hose from the turbocharger.



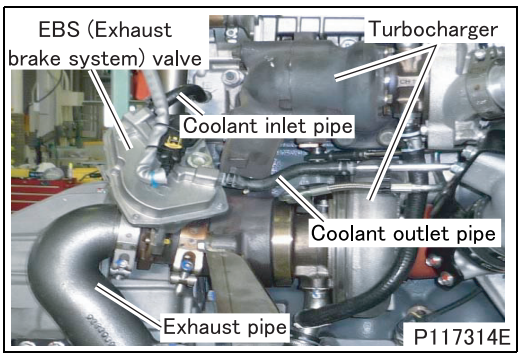
■ **Removal: Oil return hose**

- Disconnect the oil return hose.



■ **Removal: Oil pipe**

- Remove the oil pipe.

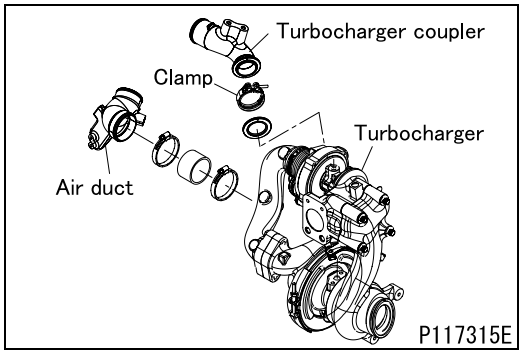


■ **Removal: Exhaust pipe, coolant inlet pipe, coolant outlet pipe, EBS (Exhaust Brake System) valve, bracket**

- Open the clamp and move it away form the position locking the coolant inlet pipe to the union on the EBS (Exhaust Brake System) valve.
- Remove the coolant inlet pipe from the EBS valve.
- Open the clamp and move it away from the position locking the coolant outlet pipe to the union on the EBS valve. Remove the coolant outlet pipe from the EBS valve.

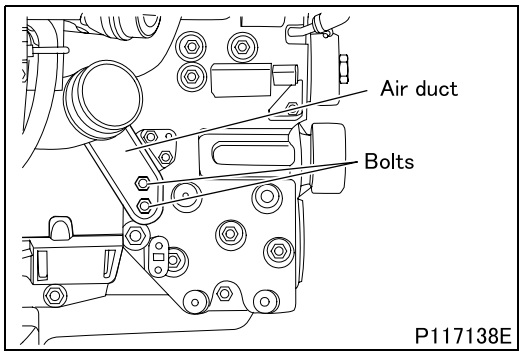
https://truckmanualshub.com/

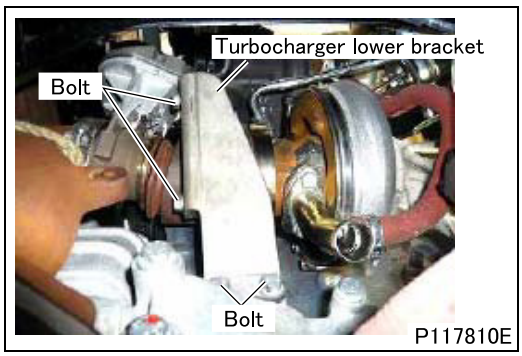
- Undo the screw, loosen the clamp and detach the exhaust pipe from the EBS valve.
- Undo the screw, loosen the clamp and remove the EBS valve from the turbocharger.



■ **Removal: Turbocharger coupler, air duct**

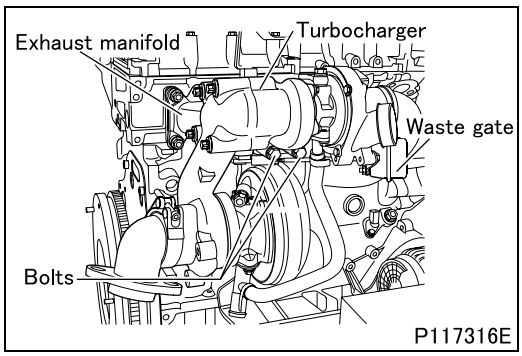
- Unfasten the clamp and remove the turbocharger coupler.
- Remove the air duct after unfastening the clamp.





■ **Removal: Bracket**

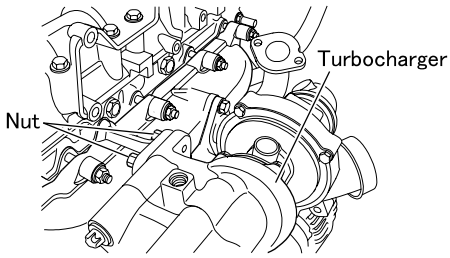
- Remove the bracket that secures the turbocharger in place.



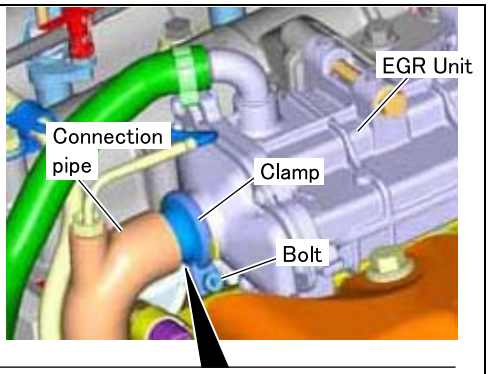
■ **Removal: Turbocharger**

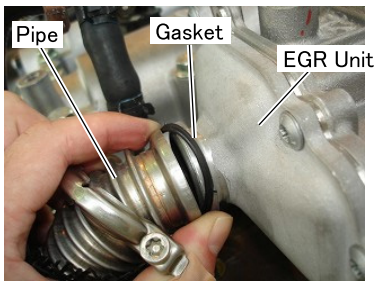
- Remove the turbocharger from the exhaust manifold.

https://truckmanualshub.com/



P117811E

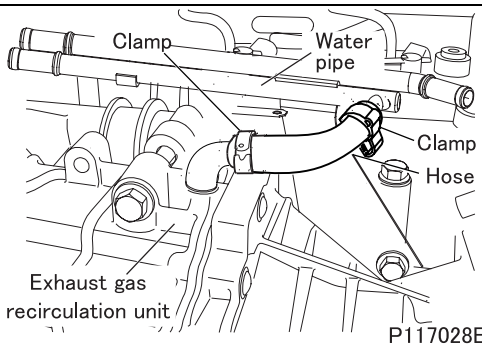




P117815E

■ **Removal: Connection Pipe**

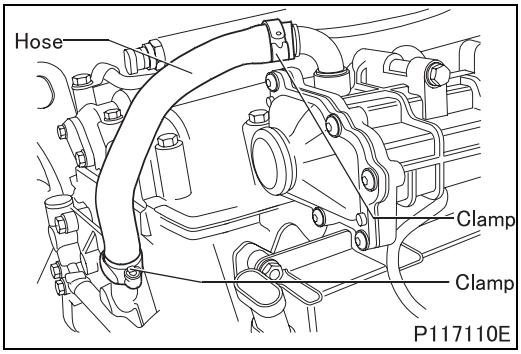
- Remove the clamp.
- Remove the connection pipe and gasket from the exhaust gas recirculation unit.



P117028E

■ **Removal: Hose**

- Open the clamps and move them away from the position locking the pipe to the water outlet pipe and EGR (Exhaust Gas Recirculation) unit.
- Remove the pipe.

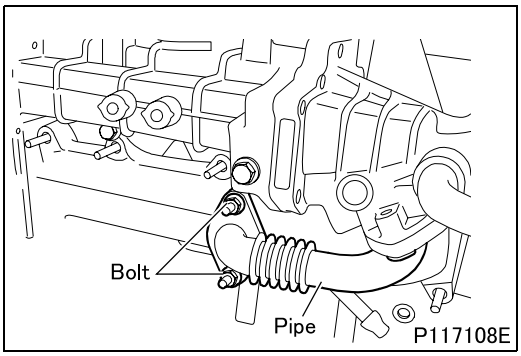


P117110E

■ **Removal: Hose**

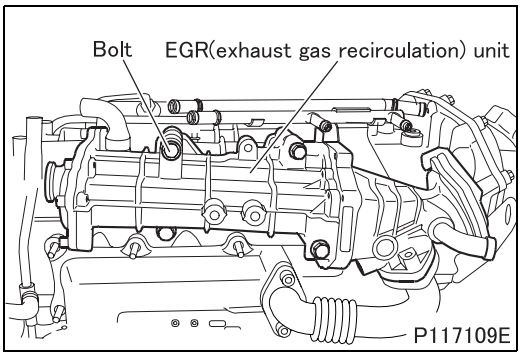
- Remove the retaining clamps.
- Remove the hose from EGR (Exhaust Gas Recirculation) and from the cover.

https://truckmanualshub.com/



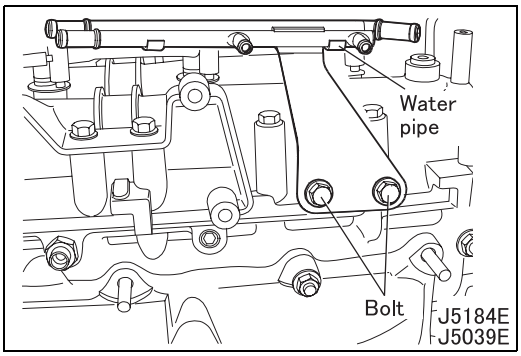
■ **Removal: EGR (Exhaust Gas Recirculation) valve pipe**

- Remove the two fixing bolts.
- Detach the pipe from the exhaust manifold, taking care to remove the gaskets.



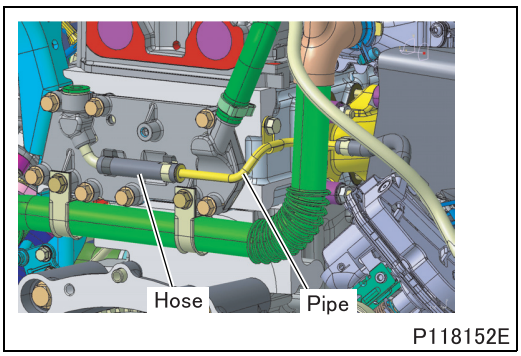
■ **Removal: EGR (Exhaust Gas Recirculation) unit**

- Remove the EGR (Exhaust Gas Recirculation) unit.



■ **Removal: Water pipe, supporting bracket**

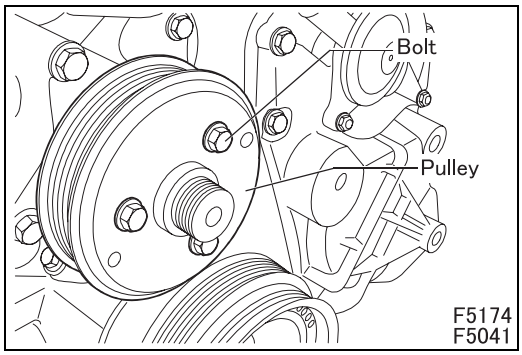
- Remove the water pipe together with the supporting bracket.



■ **Removal: Hose**

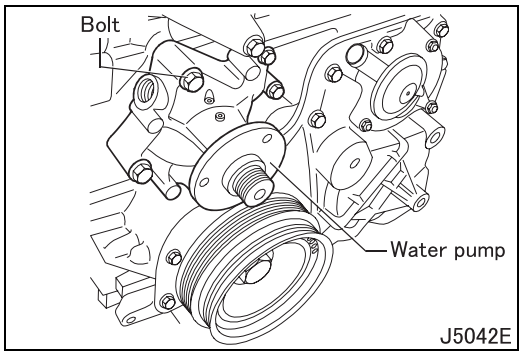
- Remove the hose.

https://truckmanualshub.com/



■ **Removal: Pulley**

- Hold the pulley using [C g], then remove the pulley from the water pump.



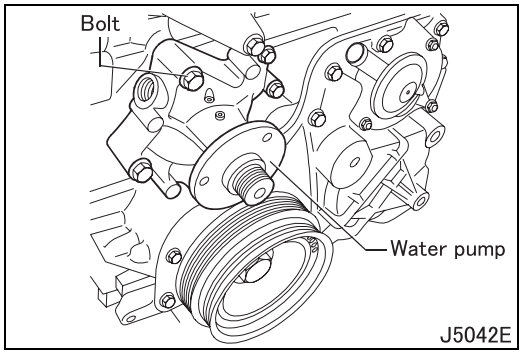
■ **Removal: Water pump**

- Remove the water pump, and remove the gasket.
- The crankcase does not have a drain plug for draining off the cooling water, so when you remove the crankcase the cooling water will flow out. In this case, rotate the engine until all of the cooling water remaining in the engine flows out.

- For further removal procedures, see later sections.
- Timing gear case
- Over head, cylinder head
- Pistons, connecting rod
- Flywheel
- Timing gears, chain

◆Installation procedure◆

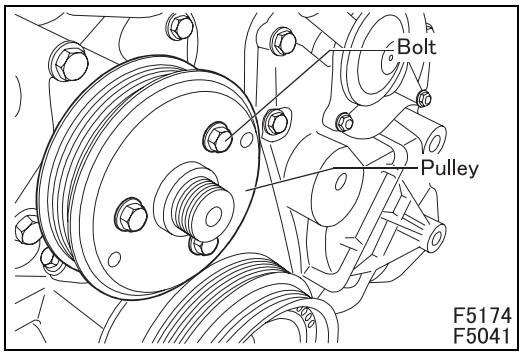
- For further installation procedures, see later sections.
- Timing gear case
- Over head, cylinder head
- Pistons, connecting rod
- Flywheel
- Timing gears, chain



■ **Installation: Water pump**

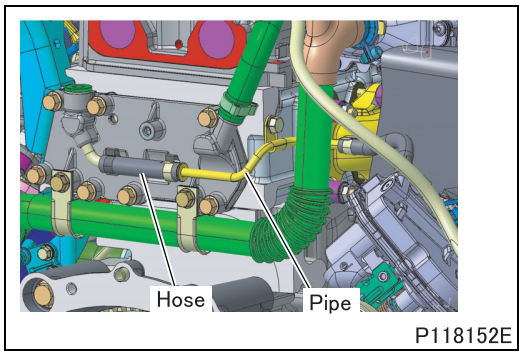
- Install the water pump with a new gasket.
- Install the screws and tighten them to the prescribed torque.
  - Bolts M10 × 1.5 × 55 mm torque 50 N·m {37 ft.lbs, 51 kgf·m}.
  - Bolts M8 × 1.25 × 45 mm torque 25 N·m {18 ft.lbs, 2.5 kgf·m}.

https://truckmanualshub.com/



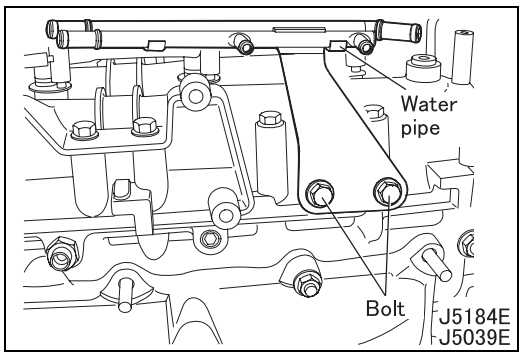
■ **Installation: Pulley**

- Install the pulley on the water pump, hold the pulley using [g], and then install the bolts to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



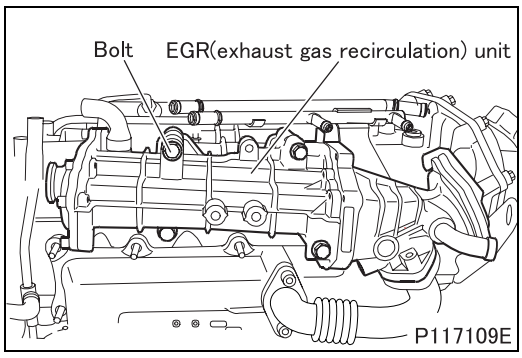
■ **Installation: Hose**

- Install the hose.



■ **Installation: Water pipe**

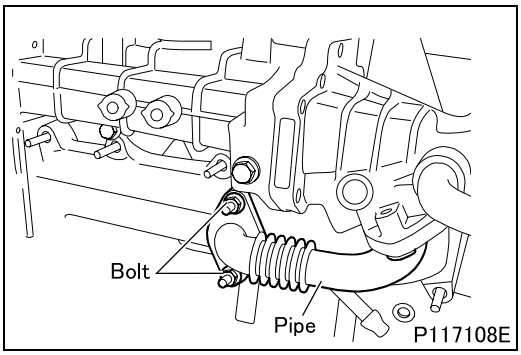
- Install the water pipe.
- Install the fixing screws and tighten it to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



■ **Installation: EGR (Exhaust Gas Recirculation) unit**

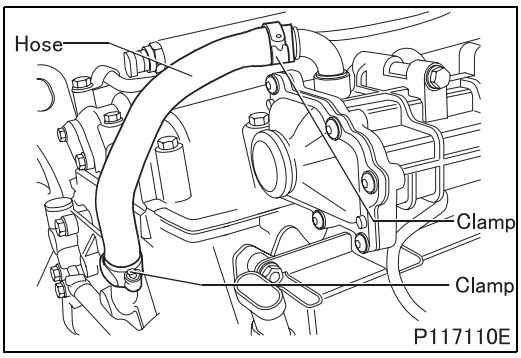
- Install the EGR unit on the overhead and tighten the fixing screws to a tightening torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.

https://truckmanualshub.com/



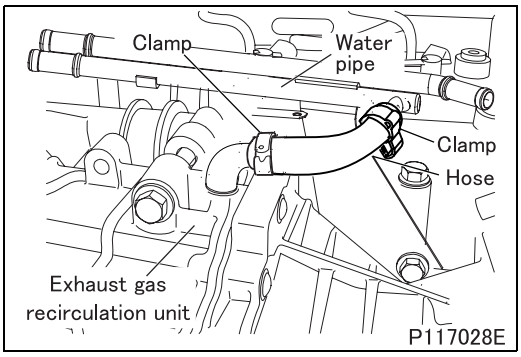
■ **Installation: EGR (Exhaust Gas Recirculation) valve pipe**

- Install the pipe with a new gasket to exhaust manifold.
- Tighten the two bolts.
- Tighten the two nuts to a torque of 30 N·m {22 ft.lbs, 3.1 kgf·m}.



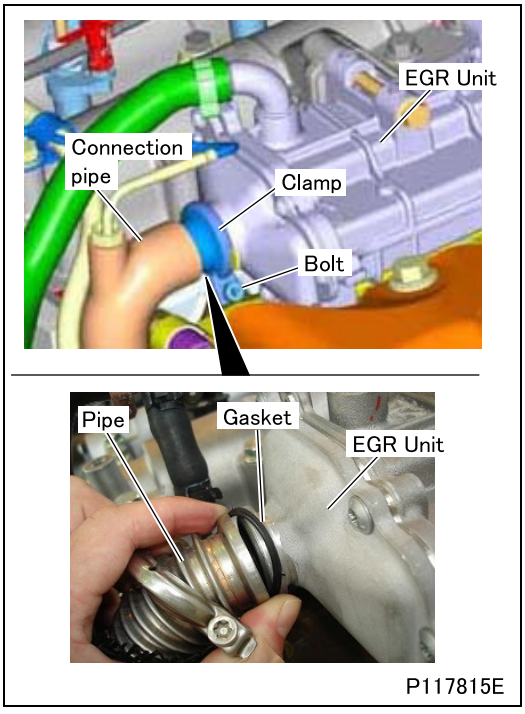
■ **Installation: Cross adapter, hose**

- Connect the hose with the heat exchanger and the cover.
- Retain it with the new clamps.



■ **Installation: Hose**

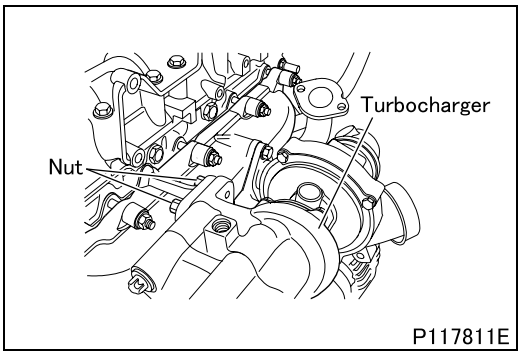
- Connect the hose between the water pipe and the EGR (Exhaust Gas Recirculation) unit.
- Fasten the hose to the adapters using the clamps.



■ **Installation: Connection pipe**

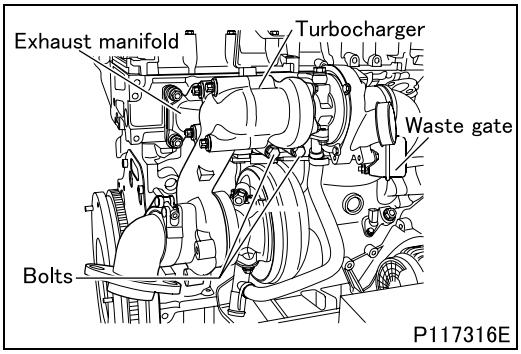
- Install the exhaust gas recirculation connection pipe and gasket on the exhaust gas recirculation unit.
- Install the clamp as shown.
- Tighten the clamp bolt.

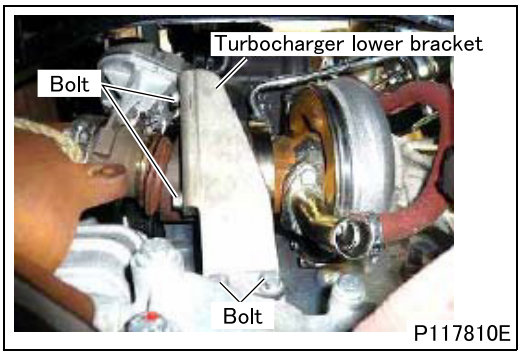
https://truckmanualshub.com/



■ **Installation: Turbocharger, exhaust manifold**

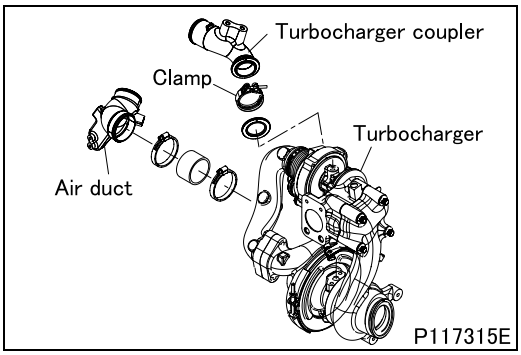
- Install the turbocharger unit with a new gasket onto the exhaust manifold complete with pipes and waste gate.
- Screw down the two lower bolts securing the turbocharger assembly to the exhaust manifold and tighten them to the prescribed torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.
- Fit the cooling pipe on the turbocharger.





■ **Installation: Bracket**

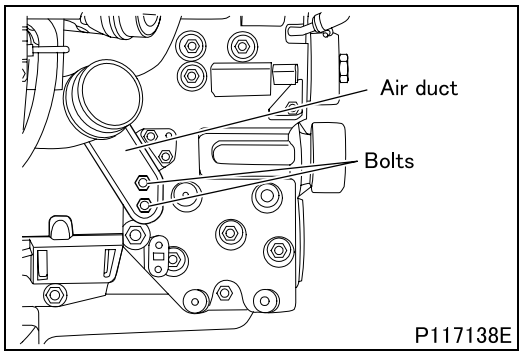
- Install the bracket.
- Install the screws and tighten it to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



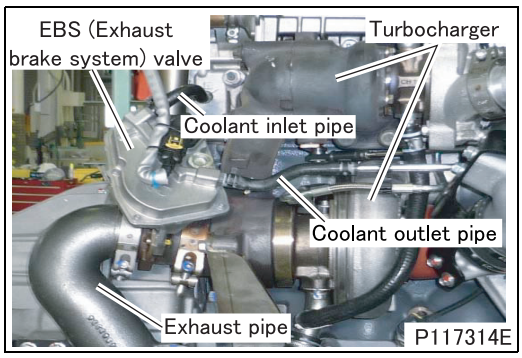
■ **Installation: Turbocharger coupler, air duct**

- Install the turbocharger coupler and air duct to the turbocharger.

https://truckmanualshub.com/

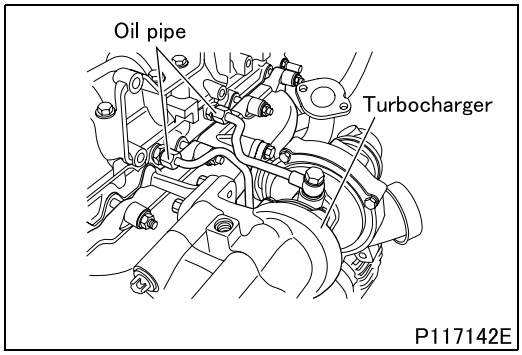


- Install the air duct.
- Install the screws and tighten it to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



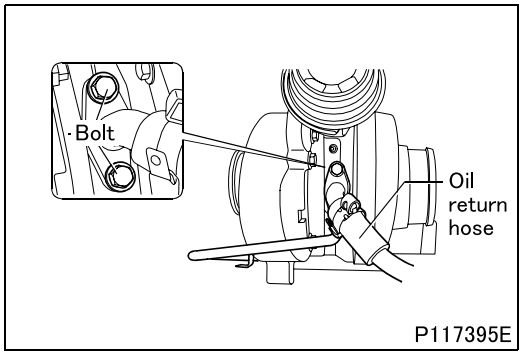
■ Installation: Exhaust pipe, coolant inlet pipe, coolant outlet pipe, EBS (Exhaust Brake System) valve, bracket

- Reinstall the EBS valve on the turbine outlet; place the clamp and tighten the screw.
- Install the exhaust pipe on the EBS valve.
- Install the clamp and position it so that the screw doesn't interfere with the operation of the valve.
- Insert the coolant inlet pipe for EBS valve in the union. Tighten the clamp to the stop position.
- Insert the coolant outlet pipe for EBS valve in the union. Tighten the clamp to the stop position.



■ Installation: Oil pipe

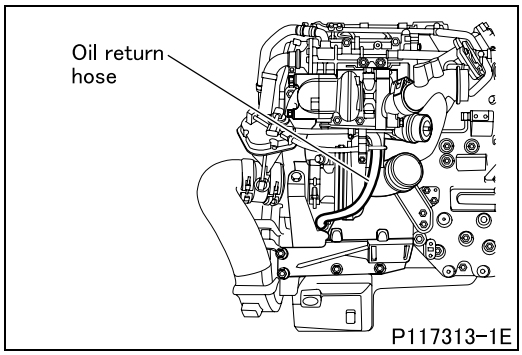
- Connect the oil pipe to the turbocharger and the cylinder head, and tighten the pipe unions to the prescribed torque: 30 N·m {22 ft.lbs, 3.1 kgf·m}.



■ Installation: Oil return hose

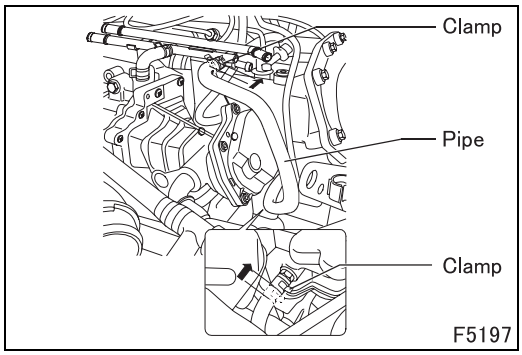
- Install the oil return pipe on the turbocharger.
- Install the fixing bolts and tighten it to a torque of 10 N·m {7.4 ft.lbs, 1.0 kgf·m}.
- Install the coolant inlet pipe on the turbocharger.
- Install without fully tightening the union.

https://truckmanualshub.com/



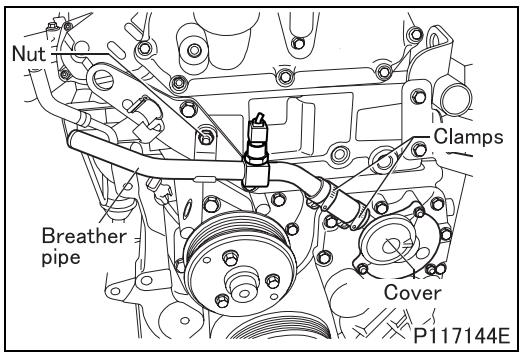
■ **Installation: Oil return hose**

- Connect the oil return hose to the turbocharger.



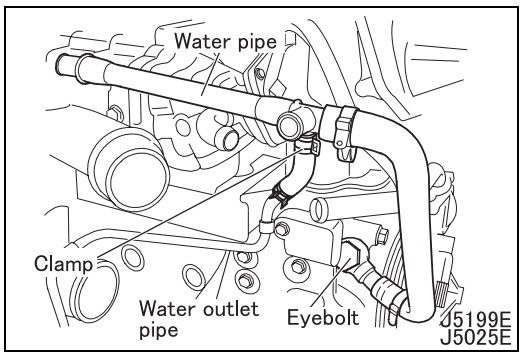
■ **Installation: Pipe**

- Install the hose with the clamp.



■ **Installation: Breather pipe**

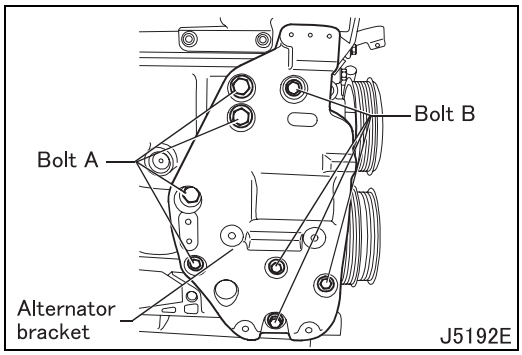
- Install the breather pipe on the cover using a new clamp.



■ **Installation: Water pipe**

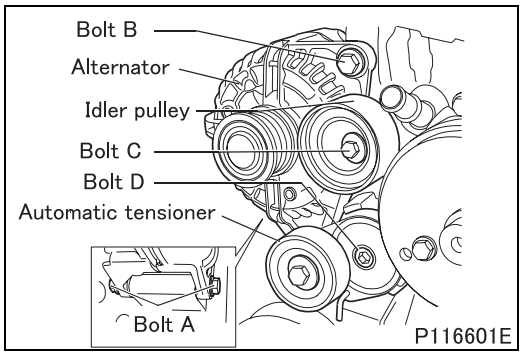
- Install the water outlet pipe on the crankcase using a new clamp.
- Install the eyebolt together with a new gasket.

https://truckmanualshub.com/



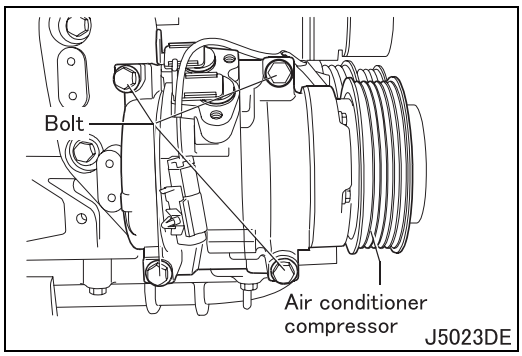
■ **Installation: Alternator bracket**

- Install the alternator bracket on the crankcase.
- Install the bolts and tighten them to the prescribed torque.
  - Bolts A M10 × 1.25 torque 50 N·m {37 ft.lbs, 5.1 kgf·m}.
  - Bolts B M8 × 1.25 torque 25 N·m {18 ft.lbs, 2.5 kgf·m}.



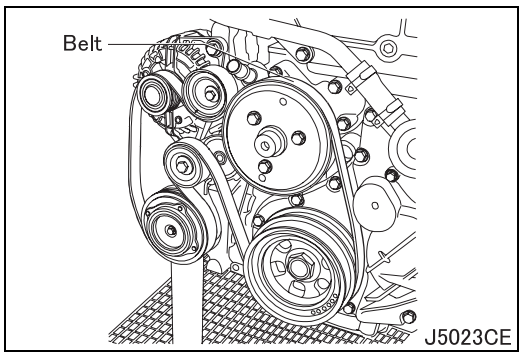
■ **Installation: Alternator, idler pulley, automatic tensioner**

- Install the alternator on the bracket, and tighten bolts A and B to a torque of 40 N·m {29 ft.lbs, 4.0 kgf·m}.
- Install the automatic tensioner, and tighten bolt D to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.
- Install the idler pulley, and tighten bolt C to a torque of 40 N·m {29 ft.lbs, 4.0 kgf·m}.



■ **Installation: Air conditioner compressor**

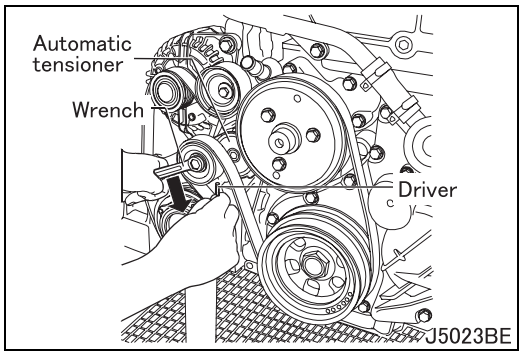
- Install the air conditioner compressor on the support.
- Install and tighten the bolts to a torque of 25 N·m {1.8 ft.lbs, 2.5 kgf·m}.



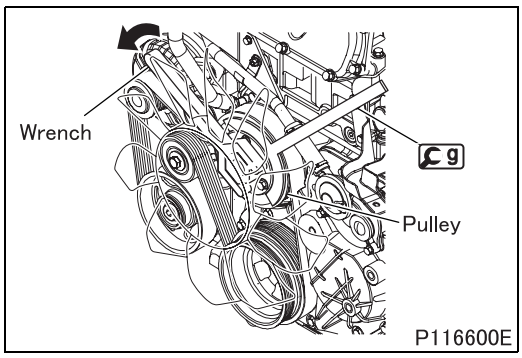
■ **Installation: Belt, automatic cooling fan coupling**

- Insert a screwdriver, or the like, into the hole in the automatic tensioner, and lock the automatic tensioner in the “Stop” position.
- Install the belt.

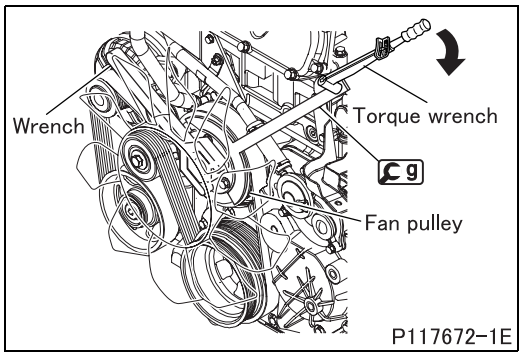
https://truckmanualshub.com/



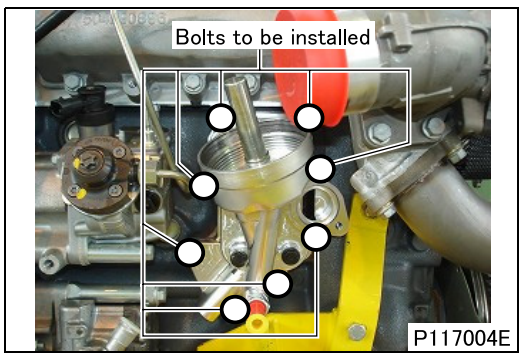
- After operating the automatic tensioner in the direction of the arrow using a wrench, remove the driver.



- Install [g] on the fan pulley.
- Holding [g], tighten the automatic cooling fan coupling to a torque of 90 to 112 N·m {66 to 83 ft.lbs, 9.2 to 11 kgf·m}.



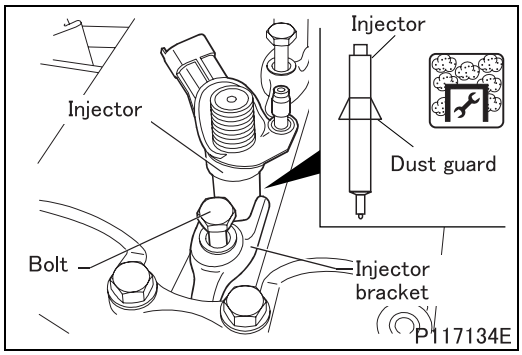
- If it is difficult to check the tightening torque of the automatic cooling fan coupling, set a torque wrench at the [g] while retaining the automatic cooling fan coupling with a wrench, turn the wrench so as to fix the fan pulley, and check the tightening torque.
- In this case, the value of the tightening torque must take into account of the 230 mm {9.06 in.} length of the [g].



■ **Installation: Oil cooler**

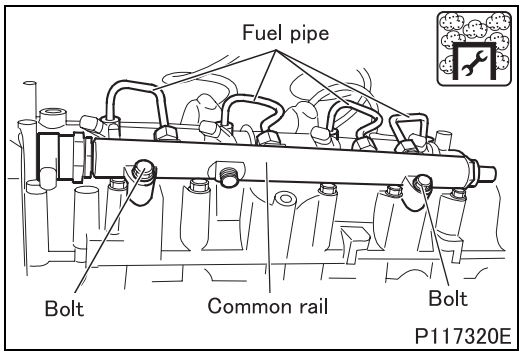
- Install the oil cooler together with a new gasket on the crankcase, and install it using a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.

https://truckmanualshub.com/



: This work requires protection against dust.

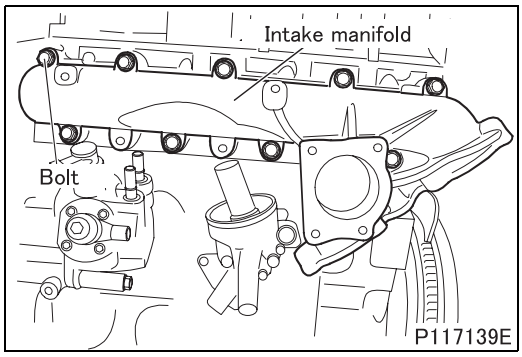
- Install a new dust guard on the injector.
- Install the injector on the engine overhead, and temporarily install the injector bracket. (The injector is of a direct sealing type, so it does not use a gasket.)
- After installing the fuel pipe and the common line, tighten the injector bracket to a torque of 32 N·m {24 ft.lbs, 3.2 kgf·m}.



■ Installation: Common rail, fuel pipe

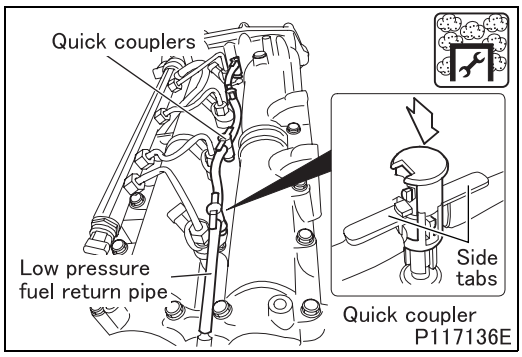
: This work requires protection against dust.

- Install the common rail on the engine overhead.
- Tighten the bolt to a torque of 28 N·m {21 ft.lbs, 2.8 kgf·m}.
- Connect the new fuel pipes to the injectors and the common rail.
- Install the injector side connectors using Cf. <Four wheel drive>
  - Connector on the injector torque 25 ± 2 N·m {18.0 ± 1.5 ft.lbs, 2.5 ± 0.2 kgf·m}
  - Install the common rail side connectors using Cd.
  - Connector on the common rail torque 19 ± 2 N·m {14.0 ± 1.5 ft.lbs, 1.9 ± 0.2 kgf·m}



■ Installation: Intake manifold

- Install the intake manifold with a new gasket.
- Tighten the screws to the prescribed torque: 25 N·m {18 ft.lbs, 2.5 kgf·m}.

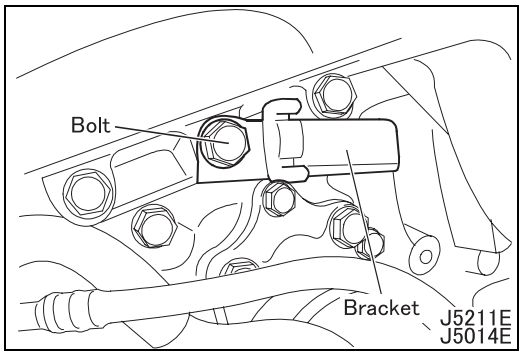


■ Installation: Low pressure fuel return pipe

: This work requires protection against dust.

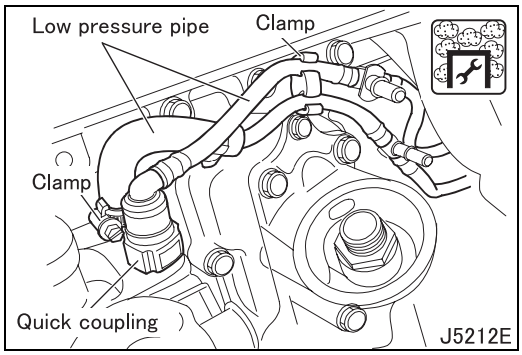
- Install the injectors low pressure fuel return pipe.
- Push down the center body of the quick coupler in the direction of the arrow.

https://truckmanualshub.com/



■ **Installation: Bracket**

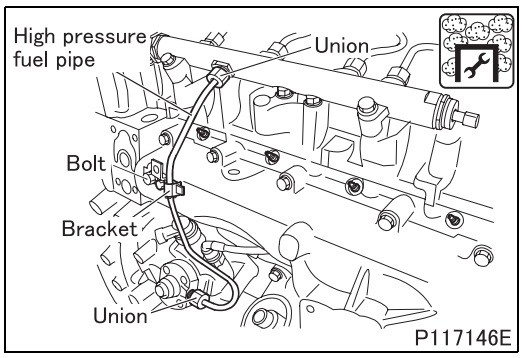
- Fit the bracket.
- Tighten the screw to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



■ **Installation: Low pressure pipe**

: This work requires protection against dust.

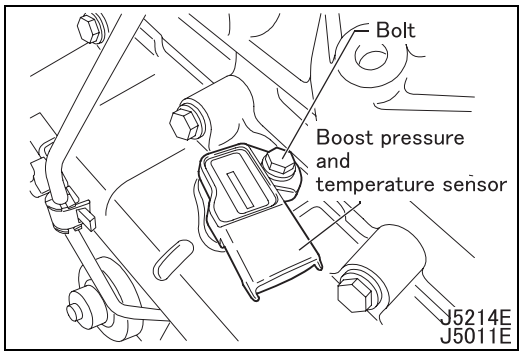
- Clamp the quick coupling and the clamp of the low pressure fuel pipe to the high pressure fuel pump, and install the low pressure fuel pipe.
- Fix the low pressure fuel pipe to the clip.



■ **Installation: High pressure fuel pipe**

: This work requires protection against dust.

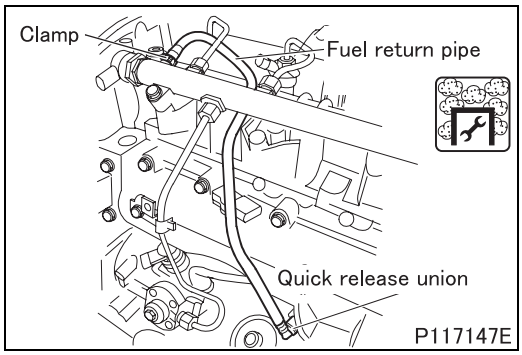
- Install a new high pressure fuel pipe.
- Screw the bracket to the intake manifold using the bolt. Tighten the bolt to a torque of 25 N·m {18.0 ft.lbs, 2.5 kgf·m}.
- Screw the connector in the high pressure fuel pump and tighten it to a torque of 19 ± 2 N·m {14.0 ± 1.5 ft.lbs, 1.9 ± 0.2 kgf·m} using e.
- Screw the connector in the common rail and tighten it to a torque of 19 ± 2 N·m {14.0 ± 1.5 ft.lbs, 1.9 ± 0.2 kgf·m} using b.



■ **Installation: Boost pressure and temperature sensor**

- Install the boost pressure and temperature sensor on the intake manifold.

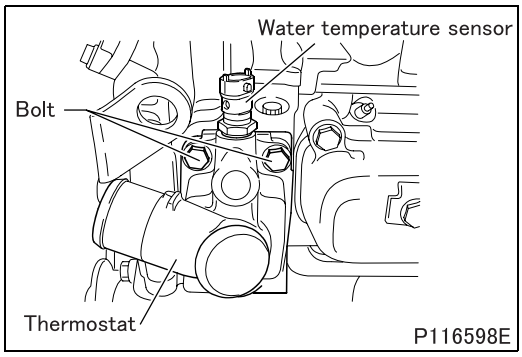
https://truckmanualshub.com/



■ **Installation: Fuel return pipe**

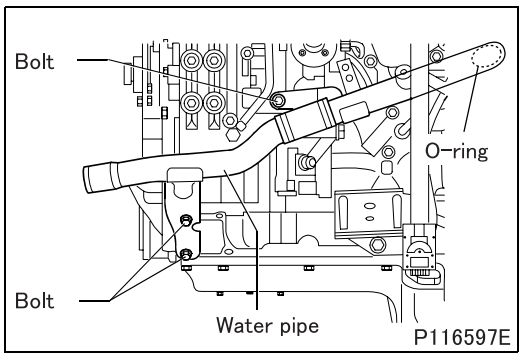
: This work requires protection against dust.

- Install the fuel return pipe.
- Fasten the fuel return pipe to the common rail by means of a clamp.
- Connect the fuel return pipe with the quick coupling to the high pressure pump return pipe.



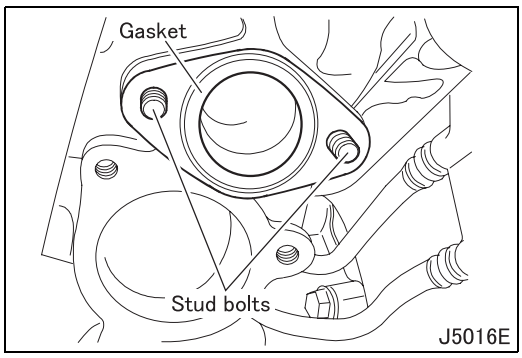
■ **Installation: Thermostat, water temperature sensors**

- Install a new gasket between the thermostat and the cylinder head, and install the thermostat on the cylinder head using a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.
- Install the water temperature sensor on the thermostat using a torque of 40 N·m {30 ft.lbs, 4.0 kgf·m}.



■ **Installation: Water pipe**

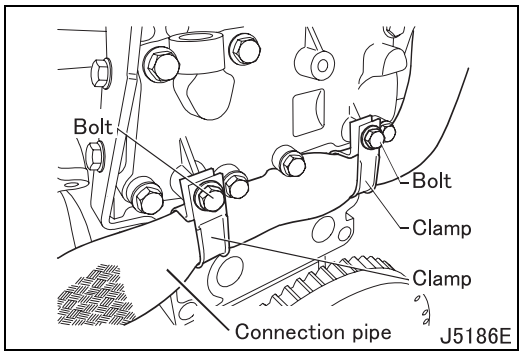
- Apply engine oil to a new O-ring.
- Install the water pipe on the oil cooler using a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



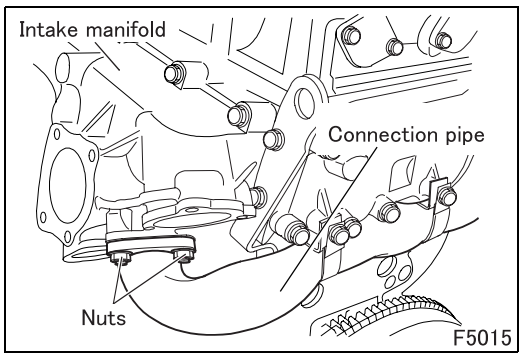
■ **Installation: Connection pipe**

- Install a new gasket.

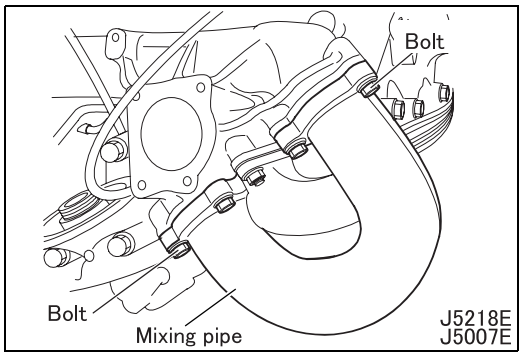
https://truckmanualshub.com/



- Install the connection pipe using a clamp.

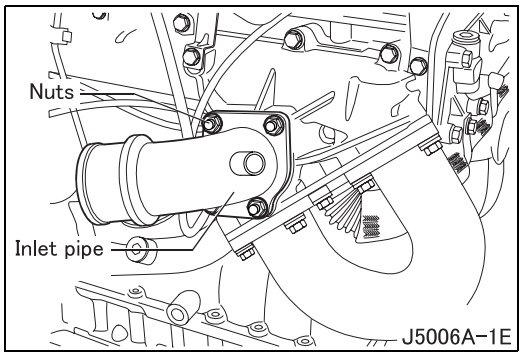


- Install the connection pipe on the intake manifold using a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



■ Installation: Mixing pipe

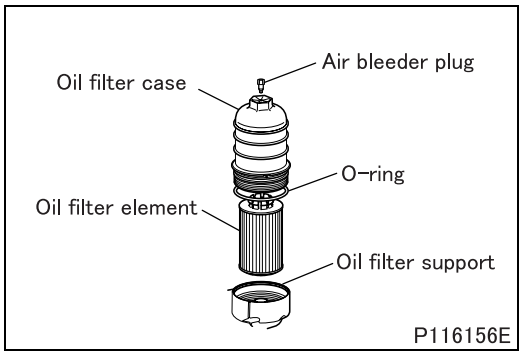
- Install a new gasket on the mixing pipe, and install the mixing pipe on the intake manifold using a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



■ Installation: Air inlet pipe

- Install the air inlet pipe together with a new gasket on the intake manifold, using a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.

https://truckmanualshub.com/



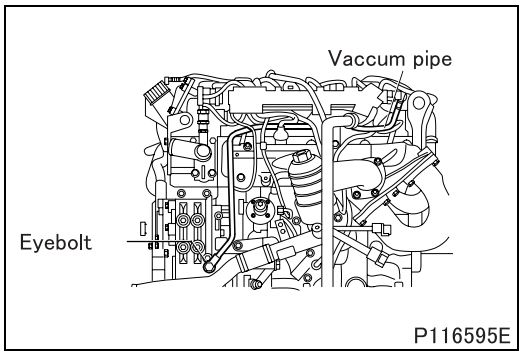
■ **Installation: Oil filter case, oil filter element**

- Apply engine oil to a new O-ring, and install the O-ring on the oil filter case.
- Use the O-ring and air bleeder plug that are provided with the new oil filter element.
- Install the oil filter element with the hole facing downward.
- Install a new air bleeder plug on the oil filter case using a torque of 1.5 ± 0.6 N·m {1.1 ± 0.4 ft.lbs, 0.15 ± 0.06 kgf·m}.

CAUTION ⚠

- **Do not overtighten the air bleeder plug. Otherwise, the air bleeder plug will be damaged.**

- Install the oil filter case on the oil filter support using a torque of 25 to 30 N·m {18 to 22 ft.lbs, 2.5 to 30 kgf·m}.



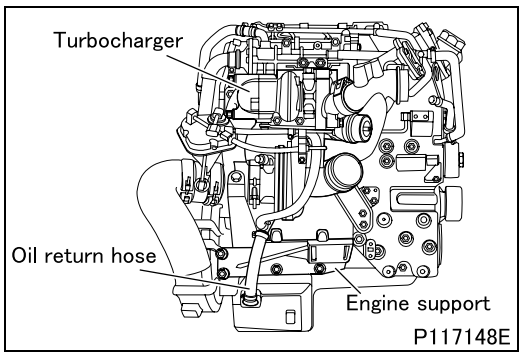
■ **Installation: Vacuum pipe**

- Install the vacuum pipe using a torque of 35 N·m {25 ft.lbs, 3.6 kgf·m}.

◆Work after installation◆

■ **Removal: Rotary stand**

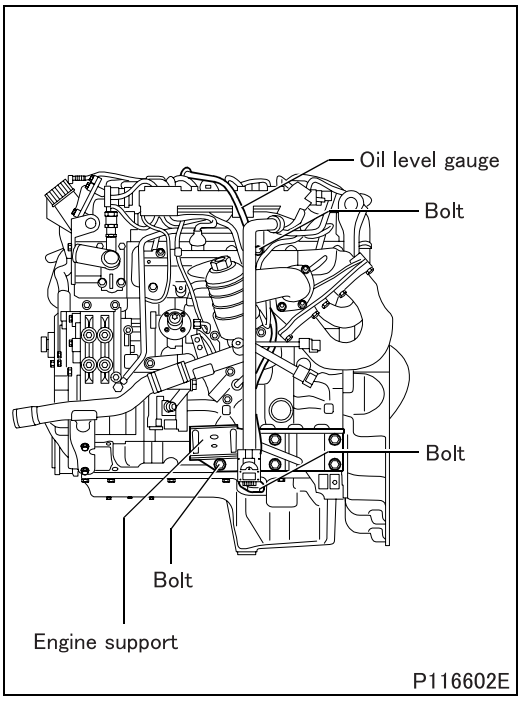
- Install the suspension hook on the engine hanger, then fix the engine hanger to the hoist, and lower the engine from the [b]. Remove the [a].



■ **Working by the engine right side**

- Connect the oil return hose to the turbocharger.
- Install the engine support using a torque of 50 N·m {37 ft.lbs, 5.1 kgf·m}.

https://truckmanualshub.com/



■ **Working on the left side of the engine**

- Install the engine support using a torque of 50 N·m {37 ft.lbs, 5.1 kgf·m}.
- Install the oil level gauge guide on the intake manifold and the oil pan using a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.

■ **Installation: Engine cable**

- Install the engine assembly with the engine cable connecting the electrical connectors.
  - Blow-by pressure sensors.
  - EBS (Exhaust Brake System) valve.
  - Glow plugs.
  - Injectors.
  - EGR (Exhaust Gas Recirculation) cooler outlet temperature sensor.
  - EGR (Exhaust Gas Recirculation) actuator.
  - Pressure sensor.
  - Pressure regulation.
  - Boost pressure and temperature sensor.
  - VGT (Variable Geometry Turbocharger) actuator.
  - Water temperature sensor.
  - Camshaft timing sensor.
  - Engine speed sensor.
  - Oil pressure sensor.

***a**: Crankshaft
⊗: Non-reusable parts

● **Installation sequence**

Follow the disassembly sequence in reverse.

https://truckmanualshub.com/

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (cover mounting)	10 {7.4, 1.0}	–
	Nut (cover mounting)		
	Bolt (camshaft timing sensor mounting)		
Tb	Bolt (distribution cover mounting)	25 {18, 2.5}	–
	Plug		
Tc	Bolt (damper pulley mounting)	350 {260, 35}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Crankshaft tip and front oil seal installer	Engine oil	As required

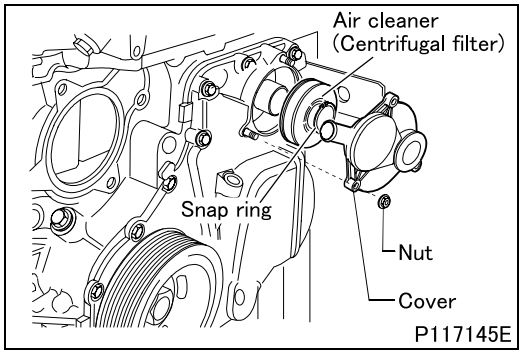
Special tools

Mark	Tool name and shape	Part No.	Application
a	Retainer, flywheel  P116334	MH064205	Stop the rotation of the flywheel
b	Seal ring remover  99340059	MH063989	Removal of front oil seal
c	Shaft, cranking  99360615	MH063969	Stop the rotation of the engine <Timing locating tool>
d	Installer, front seal  99346258	MH063962	Installation of front oil seal
e	Handle  99396039	MH063979	Centering of cover

https://truckmanualshub.com/

TIMING GEAR CASE

◆Removal procedure◆

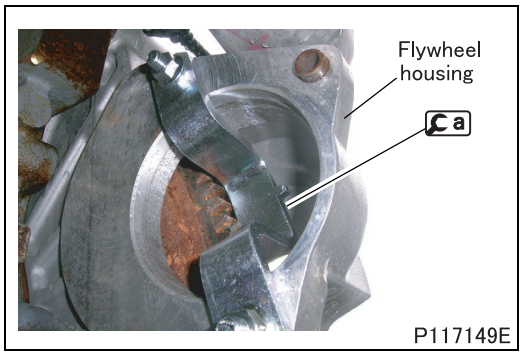


■ **Removal: Air cleaner (centrifugal filter)**

- Remove the nuts and the cover. Take off the snap ring. Pull out the air cleaner.

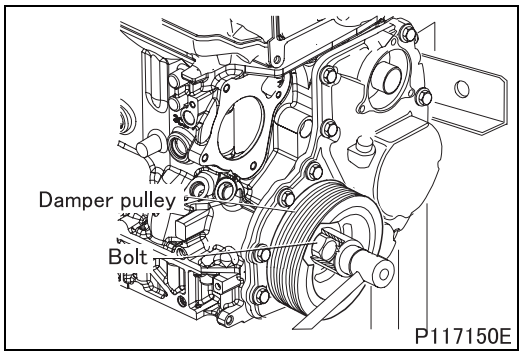
NOTE

- **The centrifugal filter and the seal ring of the cover must be changed at every removal.**

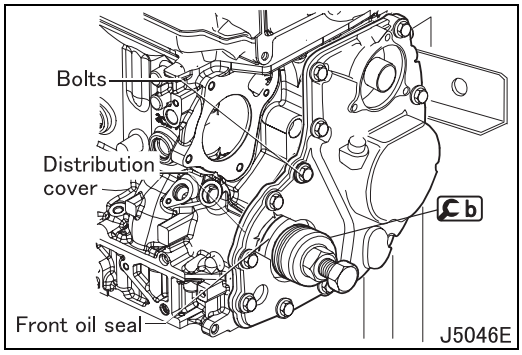


■ **Removal: Damper pulley**

- Using a, block rotation of the engine flywheel, through the starter opening.



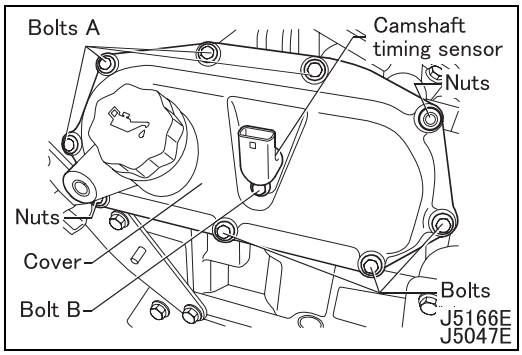
- Take out the bolt and remove the damper pulley.



■ **Removal: Distribution cover, front oil seal**

- Screw in the b to the rear of the crankshaft, and set the b.
- Remove the front oil seal from the distribution cover.
- Check the installation direction of the front oil seal.
- Remove the gasket remaining on the crankshaft.
- Remove the distributor cover.

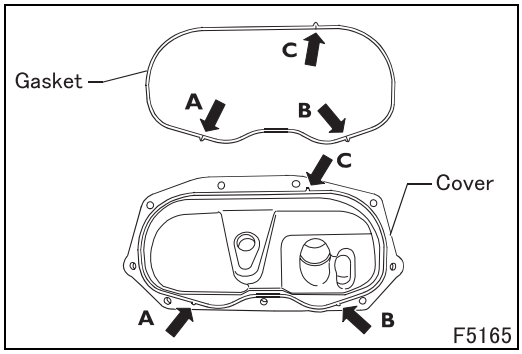
https://truckmanualshub.com/



■ Removal: Camshaft timing sensor, cover

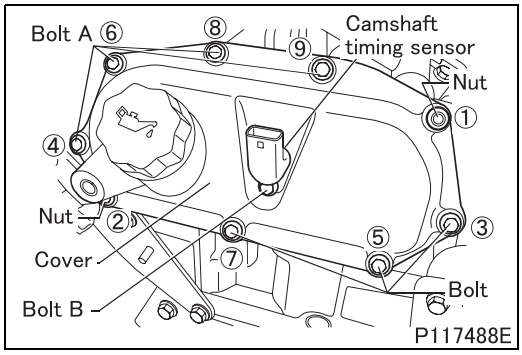
- Take out the bolt and remove the camshaft timing sensor.
- Remove the bolts and nuts; remove the cover.

◆Installation procedure◆



■ Installation: Cover, camshaft timing sensor

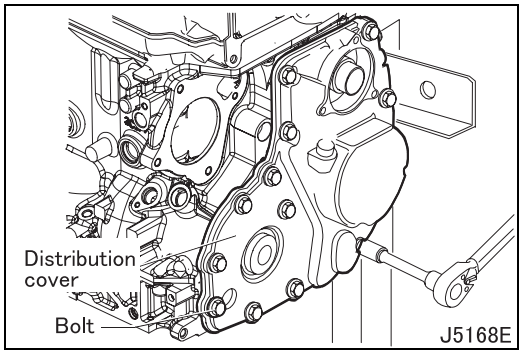
- Install a new gasket on the cover. Fit the gasket in the housing for the cover with the “knife edge” facing the engine.
- Align the three references (A, B and C) on the gasket with the seats in the cover.



- Tighten the nuts and bolts in the sequence (1) to (9) indicated in the drawing, and install the cover on the overhead cover using a torque of 10 N·m {7.4 ft.lbs, 10 kgf·m}.
- Install the camshaft timing sensor on the cover using a torque of 10 N·m {7.4 ft.lbs, 1.0 kgf·m}.

CAUTION ⚠

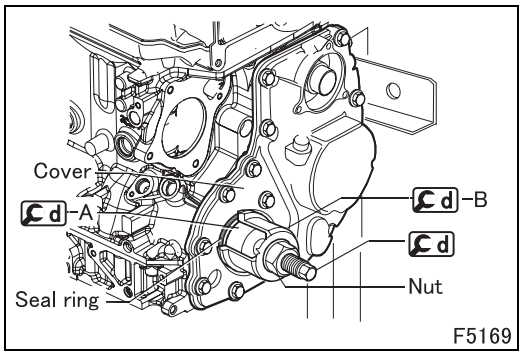
- **When installing the camshaft timing sensor, take care that the O-ring does not break.**



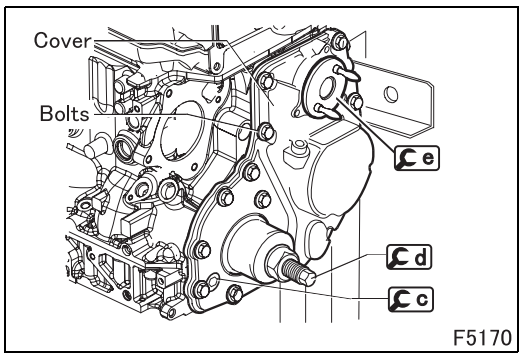
■ Installation: Distribution cover, front oil seal

- Install a new gasket on the distribution cover.
- Temporarily fix the distribution cover.

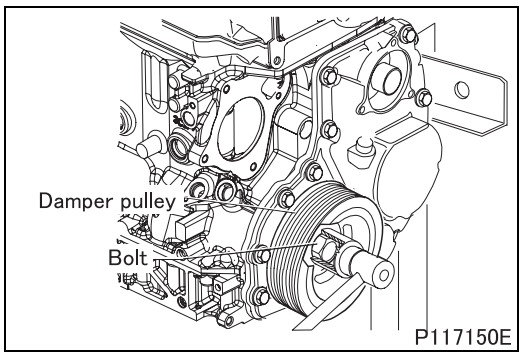
https://truckmanualshub.com/



- Clean the mounting face of the front oil seal of the distribution cover.
- Apply engine oil to the inner side of the new front oil seal and also to the crankshaft.
- Carefully install the front oil seal on the d-B.
- Place the d-B over the d-A, and tighten the nut until the front oil seal is completely installed on the cover.

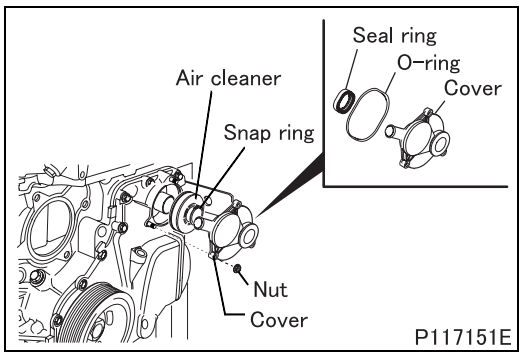


- Install the e in the housing of the air cleaner in order to center the cover.
- Turn the handle of the e, and confirm that the e rotates freely.
- Remove the plug.
- Using the c, confirm that the engine timing remains unchanged.
- While checking the rotation of the e, tighten the cover gradually, and finally tighten it to the specified torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.
- Remove the e, d and c.
- Install the plug using a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



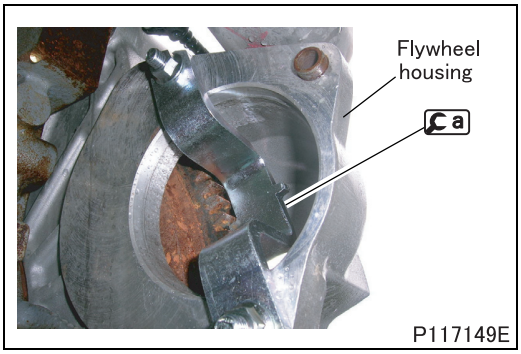
■Installation: Damper pulley and air cleaner

- Install the damper pulley and temporarily tighten it.



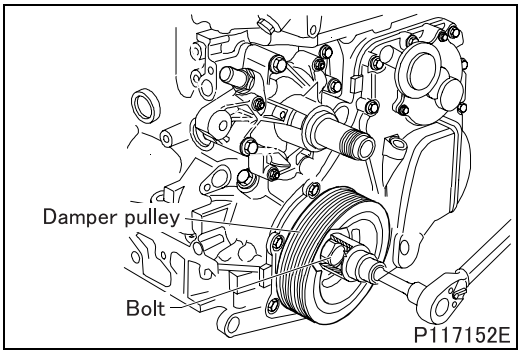
- Install on the new air cleaner with a snap ring.
- Install a new seal ring and O-ring on the cover.
- Install the cover on the distribution cover.
- Tighten the nut to a torque of 10 N·m {7.4 ft.lbs, 1.0 kgf·m}.

https://truckmanualshub.com/



■ **Installation: Damper pulley**

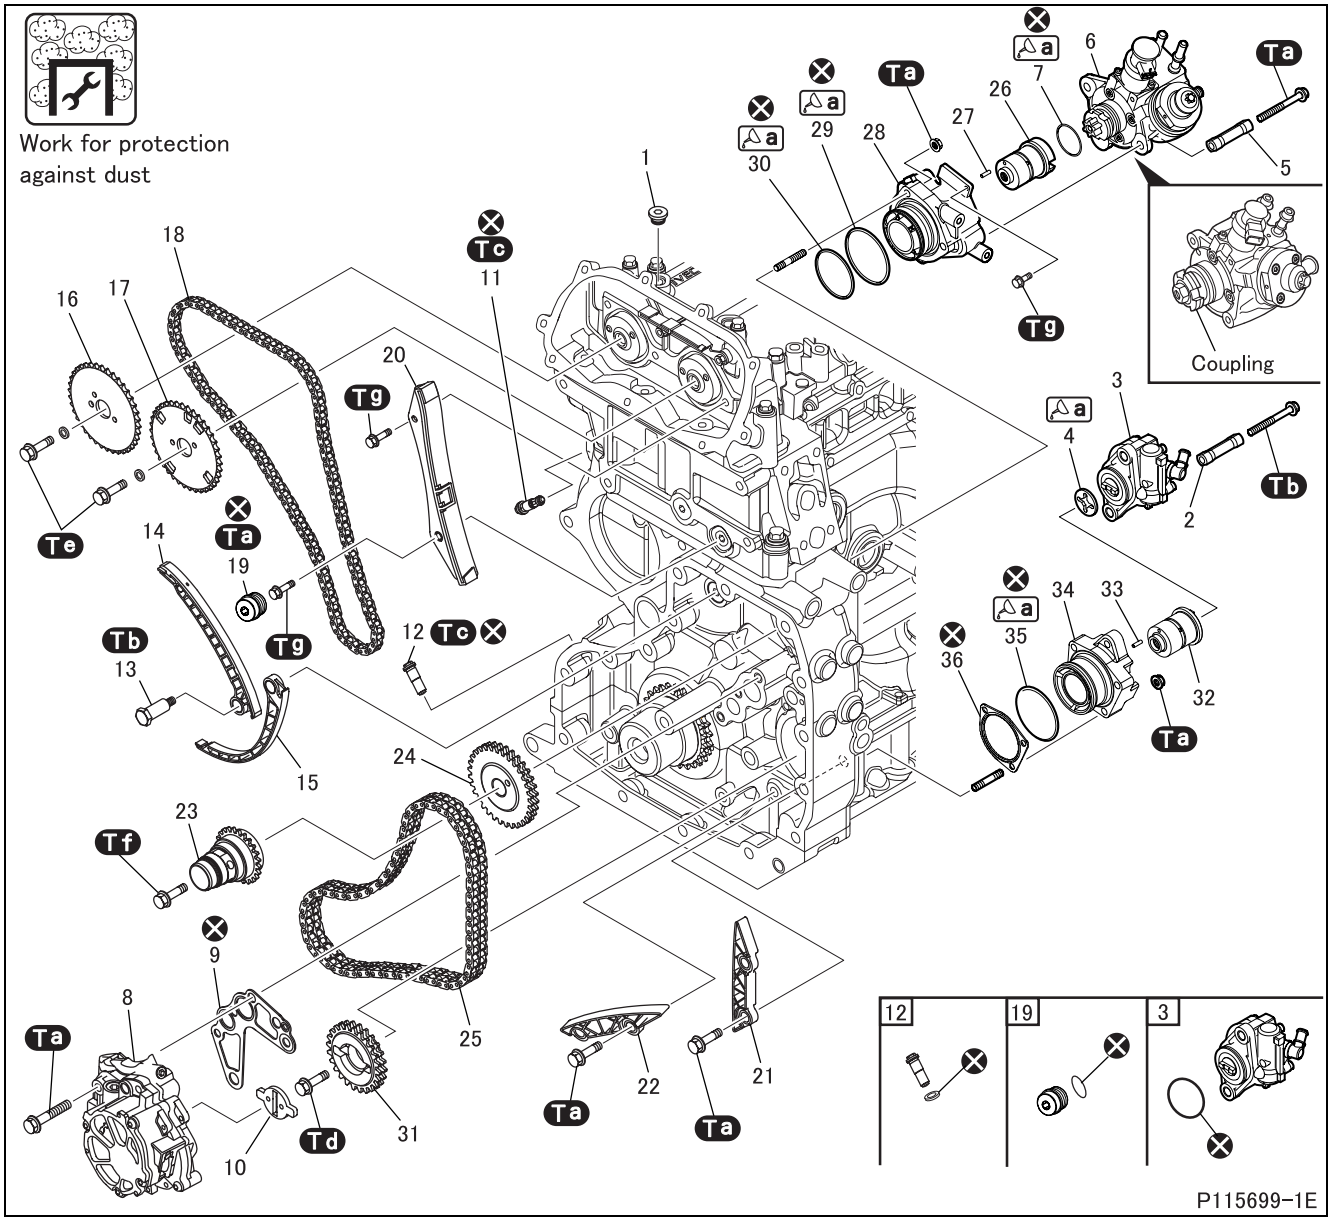
- Prevent the flywheel from rotating using a through the starter opening.



- Install the damper pulley.
- Tighten the bolt to a torque of 350 N·m {260 ft.lbs, 35 kgf·m}.

https://truckmanualshub.com/

TIMING GEAR, CHAIN



● **Removal sequence**

1 Lock plug
2 Spacer
3 Power steering oil pump (See Gr37.)
4 Coupling
5 Spacer
6 High pressure fuel pump (See Gr13.)
7 O-ring
8 Oil pump/vacuum unit (See Gr12 and Gr35.)
9 Gasket
10 Oil pump coupling
11 Upper chain stretcher
12 Lower chain stretcher
13 Mobile skid shaft
14 Upper mobile skid
15 Lower mobile skid
16 Camshaft control gear (exhaust)

28 High pressure fuel pump support
29 O-ring
30 O-ring
31 Oil pump/vacuum unit gear
32 Power steering oil pump control shaft
33 Locating pin
34 Power steering oil pump support
35 O-ring
36 Gasket

⊗: Non-reusable parts

https://truckmanualshub.com/

 : This work requires protection against dust.

- If fine dust enters the high pressure fuel pump, engine performance will significantly be affected. Be sure to cover the openings after removing parts such as pipes.

NOTE

- **Both chains and related parts must be replaced as a kit.**
- **A chain stretcher with self-locking mechanism needs to be replaced whenever it has been removed. The chain stretcher also needs to be replaced if the piston is inadvertently removed from the chain stretcher.**
- **Once the pump housing is unlocked and the piston protrudes, the chain stretcher cannot be assembled as before.**

● Installation sequence

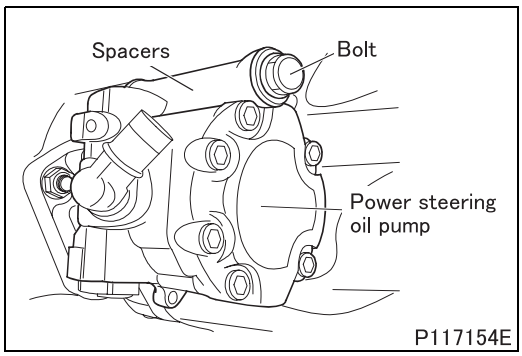
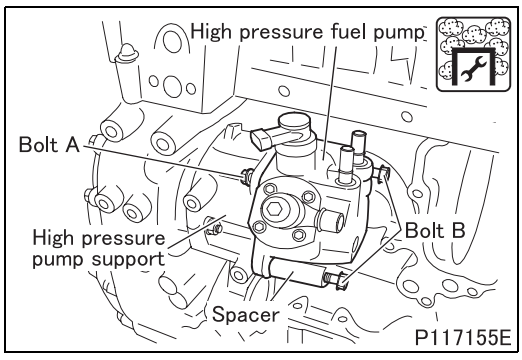
◆Removal procedure◆



■ Removal: Power steering oil pump

- Remove the bolts with the spacers and detach the power steering oil pump.

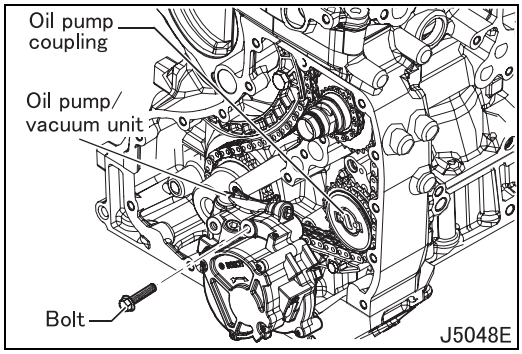


■ Removal: High pressure fuel pump

: This work requires protection against dust.

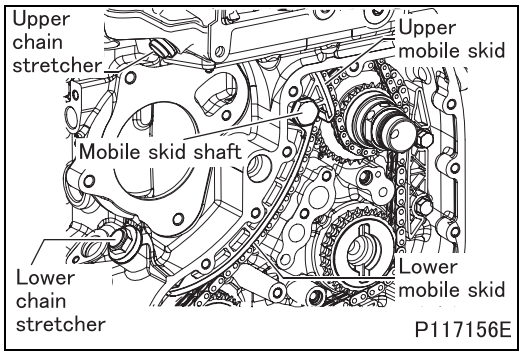
- Set the engine to top dead center at the #1 cylinder.
- Loosen bolt A, and then remove it.
- Loosen bolt B, and remove it together with the spacer.
- Remove the high pressure fuel pump from the high pressure fuel pump support.
- Check the direction of the coupling installed on the high pressure fuel pump.

https://truckmanualshub.com/



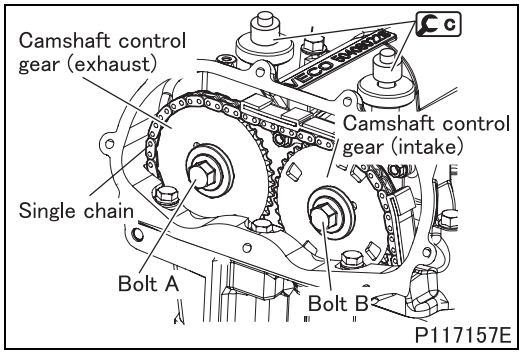
■ **Removal: Oil pump/vacuum unit**

- Remove the oil pump/vacuum unit.
- Remove the oil pump coupling.



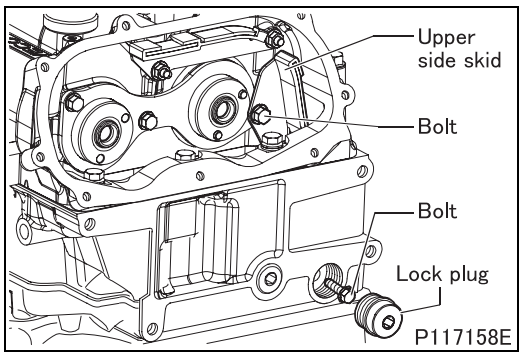
■ **Removal: Mobile skid shaft, mobile skid**

- Remove the chain stretcher: upper and lower.
- Remove the mobile skid shaft and disassemble the mobile skid: lower and upper.



■ **Removal: Camshaft control gear and single chain**

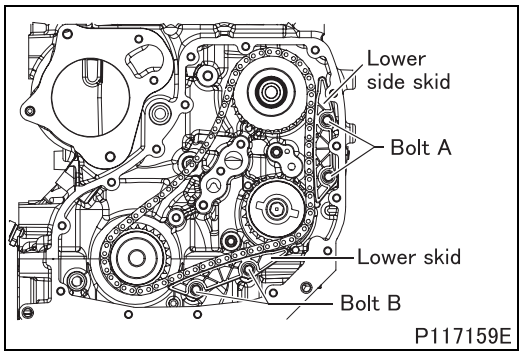
- Install [C] on the camshaft slot through the overhead screw hole into the cam slot.
- Remove bolts A and B, and then remove the camshaft control gear (exhaust), camshaft control gear (intake) and single chain. (The single chain has no preferred mounting orientation (front/ back).)



■ **Removal: Lock plug, upper side skid**

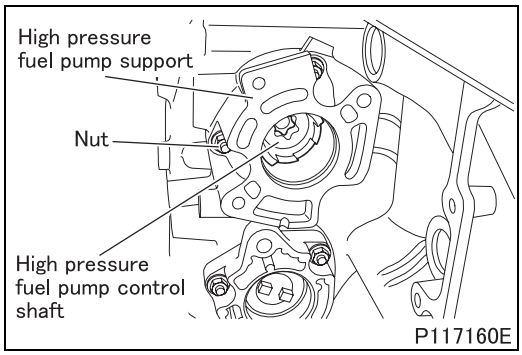
- Remove the rubber cap, the screws and the upper side skid.

https://truckmanualshub.com/



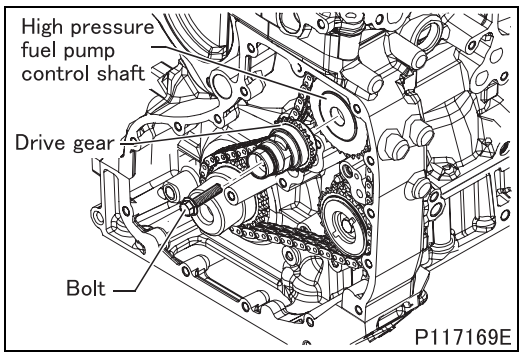
■ **Removal: Lower side skid, lower skid**

- Remove the bolts and the lower side skid.
- Remove the bolts and the lower skid.

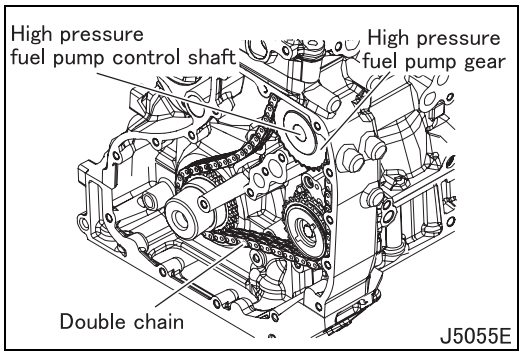


■ **Removal: Drive gear, high pressure fuel pump gear, double chain**

- Insert an appropriate wrench (T90 Torx bit socket) into the high pressure fuel pump control shaft to prevent the shaft from rotating.

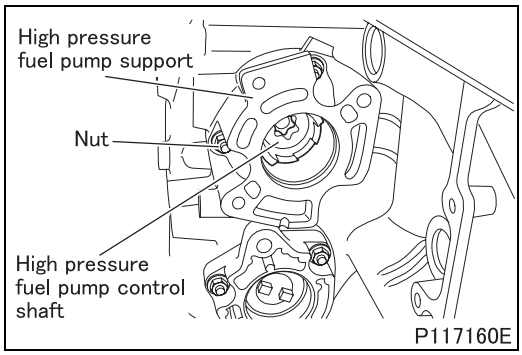


- Remove the screw and the single chain drive gear from the high pressure fuel pump control shaft.



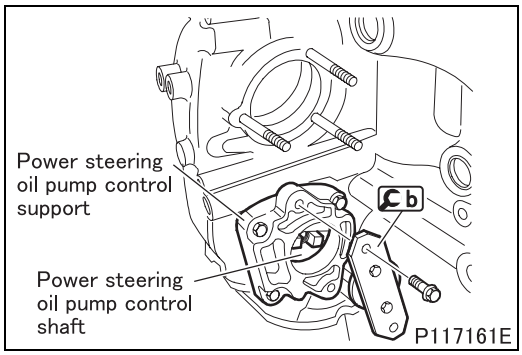
- Remove the high pressure fuel pump gear double chain and the double chain from the high pressure fuel pump control shaft. (The double chain has no preferred mounting orientation (front/back).)

https://truckmanualshub.com/



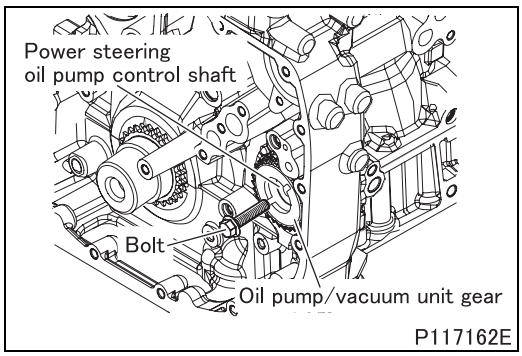
■ **Removal: High pressure fuel pump control shaft, support**

- Remove the high pressure fuel pump control shaft.
- Remove the nuts and the support.

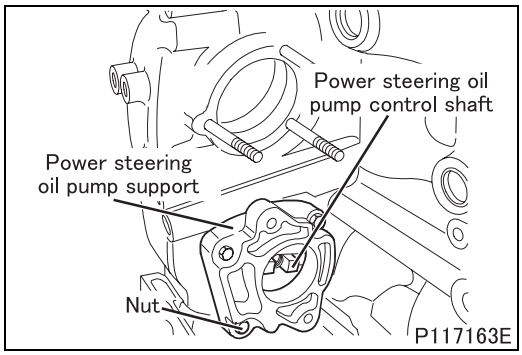


■ **Removal: Oil pump/vacuum unit gear**

- Stop the rotation of the power steering oil pump control shaft by inserting b in the shaft and fastening the b on the support by means of the bolts.



- Remove the bolt and the gear from the hydraulic power steering pump control shaft.

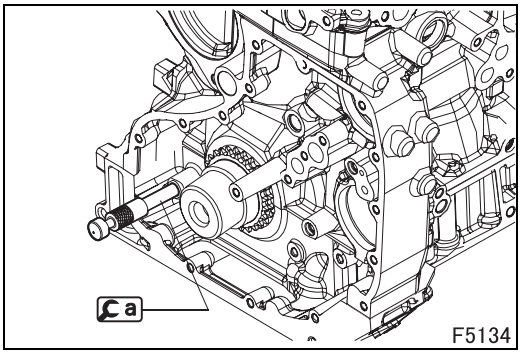


■ **Removal: Power steering oil pump control shaft, support**

- Remove the hydraulic power steering pump control shaft.
- Remove the nuts and the support.

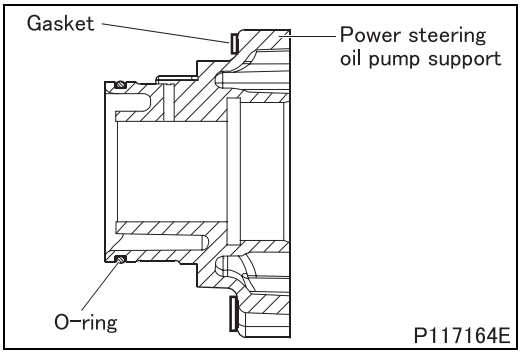
https://truckmanualshub.com/

◆Installation procedure◆



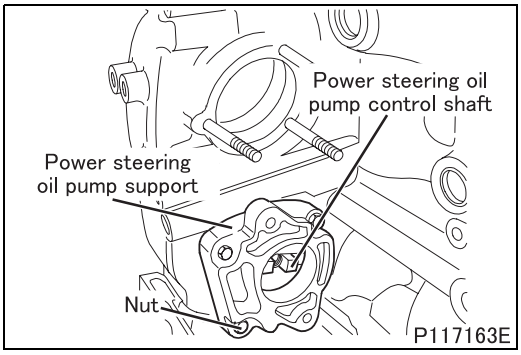
■ Installation: Cranking shaft

- Using the a, rotate the crankshaft and install it by inserting it into the crankshaft hole from the cylinder lock hole.
- When rotating the crankshaft, be careful that it does not interfere with the valve.
- Stop rotating the engine when it is in a condition that enables the subsequent parts to be installed on it.

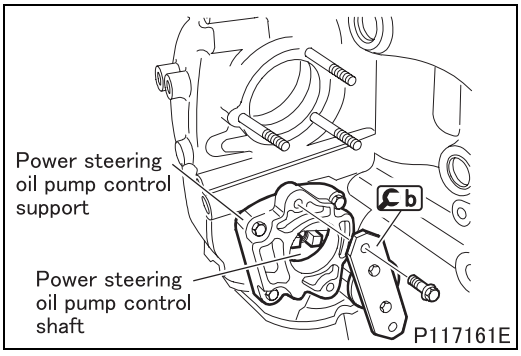


■ Installation: Support, power steering oil pump control shaft

- Lubricate the O-ring with engine oil and install it on the support.
- Take care not to damage the O-ring.

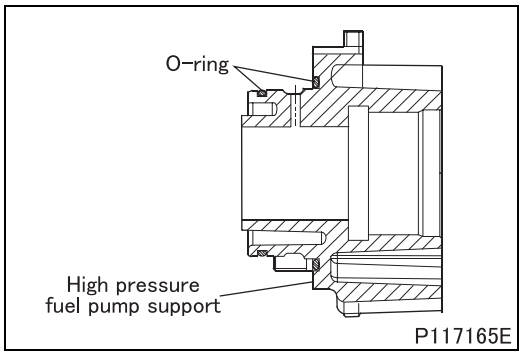


- Install a new gasket and the power steering oil pump support, screw in the nuts, and then tighten them to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.
- Install the positioning pin on the power steering oil pump control shaft.
- Install the power steering oil pump control shaft on the inside of the power steering oil pump support.



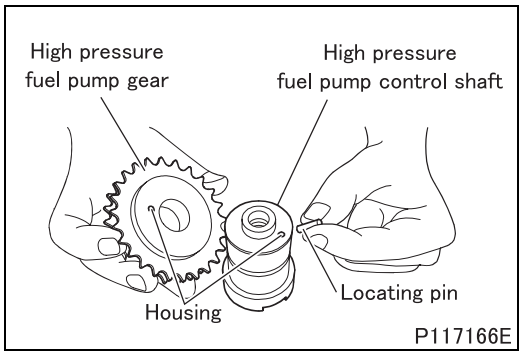
- Stop the hydraulic power steering pump control shaft rotation of the hydraulic power steering pump by inserting in the latter the b and fastening the b on the support by means of the bolts.

https://truckmanualshub.com/

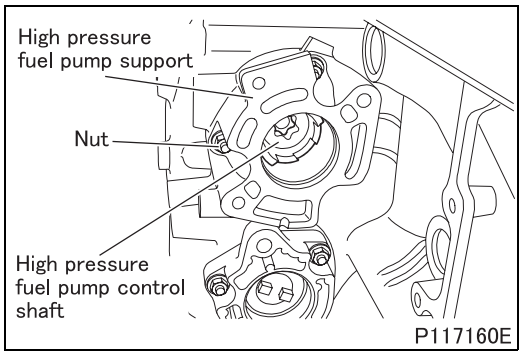


■ **Installation: High pressure fuel pump support, high pressure fuel pump control shaft**

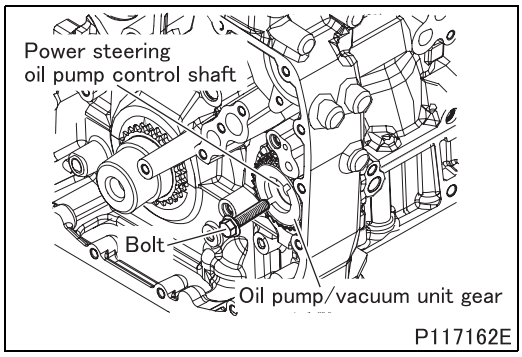
- Lubricate the new O-rings with engine oil and install them on the support.



- There is a housing for the locating pin in the through hole in the high pressure fuel pump gear.
- The through hole in the high pressure fuel pump gear has a reference point which needs to be kept in a vertical position when timing the pump.
- There is a housing for the locating pin in the high pressure fuel pump control shaft.
- The position of the housing for the locating pin in the shaft has been determined so as to ensure the timing between the pump and crankshaft.



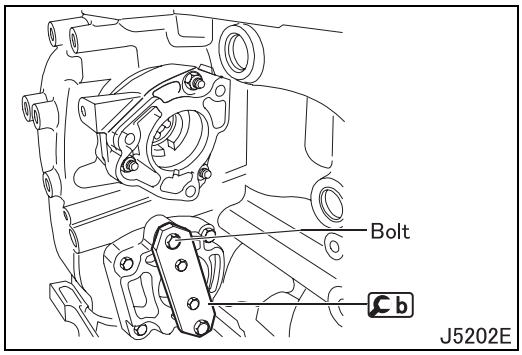
- Install the support and the nuts and tighten them to the prescribed torque (25 N·m {18 ft.lbs, 2.5 kgf·m}).
- Install the high pressure fuel pump control shaft of the high pressure fuel pump.



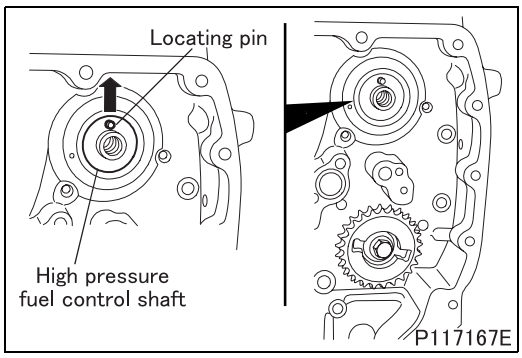
■ **Installation: Oil pump/vacuum unit gear**

- Install the oil pump/vacuum unit gear on the power steering oil pump control shaft.

https://truckmanualshub.com/

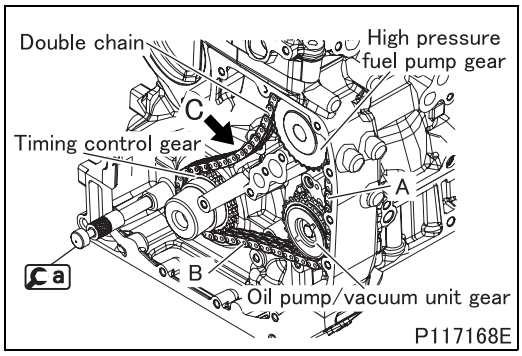


- Remove the bolt, and then remove the b.

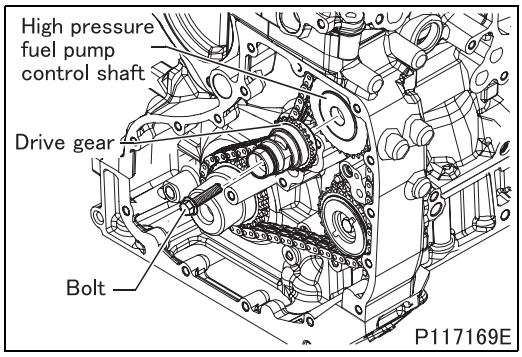


■ **Installation: Drive gears, double chain**

- As far as possible, install the high pressure fuel pump control shaft with the locating pin facing directly upward.

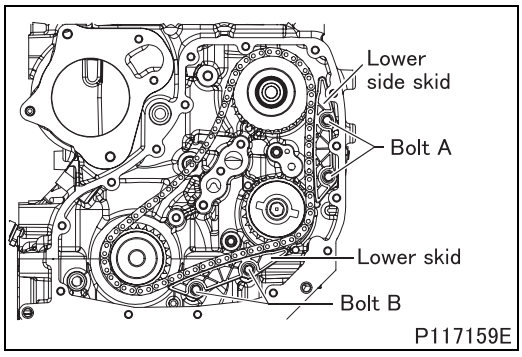


- Position the high pressure fuel pump gear so that the chamfered side is facing the drive gear, and install the double chain on the high pressure fuel pump gear.
- Align the high pressure fuel pump gear with the locating pin of the high pressure fuel pump control shaft, and then install it on the control shaft.
- After installing the fuel pump gear, press C of the double chain, and confirm that the chain is taut at sections A and B, and also that the locating pin of the high pressure fuel pump gear is facing directly upward.



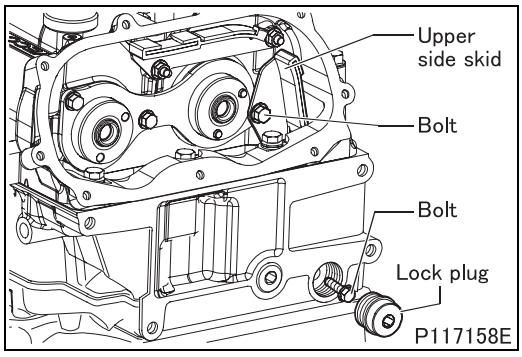
- Clean the contacting faces of the drive gear and the high pressure fuel pump gear.
- Install the drive gear on the high pressure fuel pump control shaft, and temporarily tighten the bolt (to the extent that the drive gear can be easily rotated by hand).

https://truckmanualshub.com/



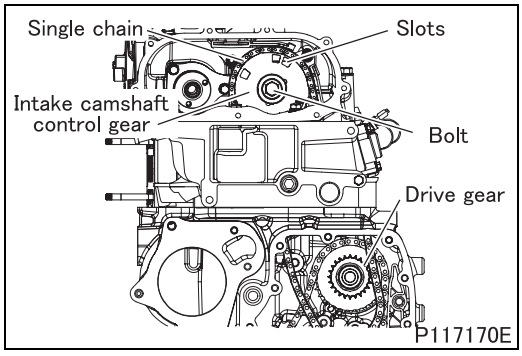
■ **Installation: Lower side skid, lower skid**

- Inspect the condition of each skid, and replace any worn skids.
- Install the lower skid, then screw in the bolt and tighten it to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.
- Install the lower side skid, and tighten the bolt to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



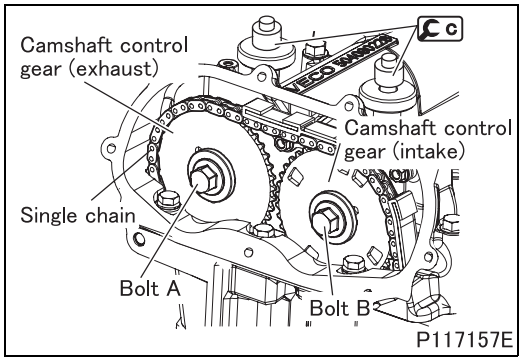
■ **Installation: Upper side skid**

- Install the upper side skid, and tighten the bolt to a torque of 10 N·m {7.4 ft.lbs, 1.0 kgf·m}.
- Tighten the bolt at the rear of the lock plug to a torque of 10 N·m {7.4 ft.lbs, 1.0 kgf·m}, then tighten the new lock plug to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



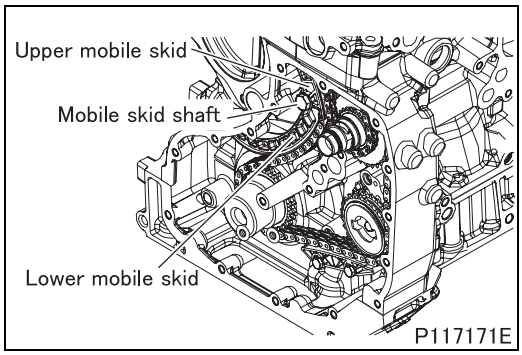
■ **Installation: Single chain, gear**

- Install the camshaft control gears (intake and exhaust) with the stamped side of the gear facing the camshaft side.
- Install the camshaft control gear (intake) with the slot on the gear at the position shown in the illustration, and then temporarily tighten the bolt.
- Install the single chain on the drive gear and the camshaft controller gear (intake).



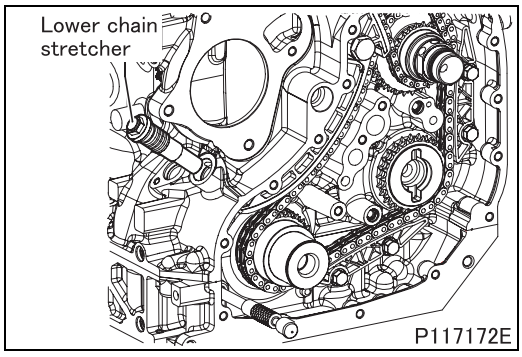
- Use the largest of the three dowel pin insertion holes in the camshaft control gear (exhaust).
- Place the single chain on the camshaft control gear (exhaust), and temporarily tighten the gear mounting bolt (to the extent that the drive gear can be easily rotated by hand).
- Then, check to see if the single chain between the exhaust and intake camshaft control gears can be tensioned by removing the play of the dowel pins in the insertion holes.

https://truckmanualshub.com/



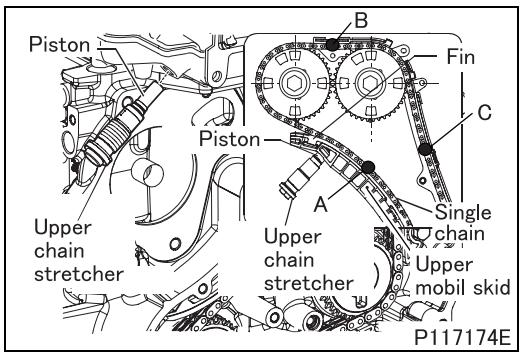
■ **Installation: Lower mobile skid, upper mobile skid**

- Check the condition of the lower and upper mobile skids. If the skids are worn, replace them.
- Install the lower and upper mobile skids, and install the mobile skid shaft on the crankshaft.
- Tighten the mobile skid shaft to a torque of 40 N·m {30 ft.lbs, 4.0 kgf·m}.



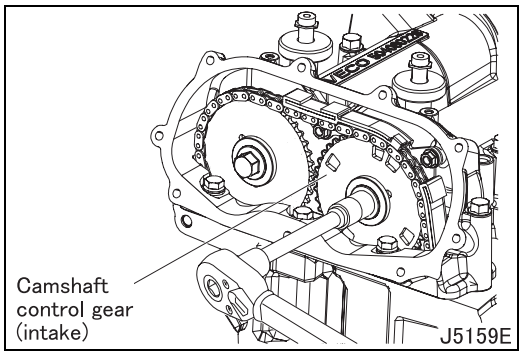
■ **Installation: Lower chain stretcher**

- Install the lower chain stretcher, and tighten it to a torque of 50 N·m {37 ft.lbs, 5.0 kgf·m}.



■ **Installation: Upper chain stretcher**

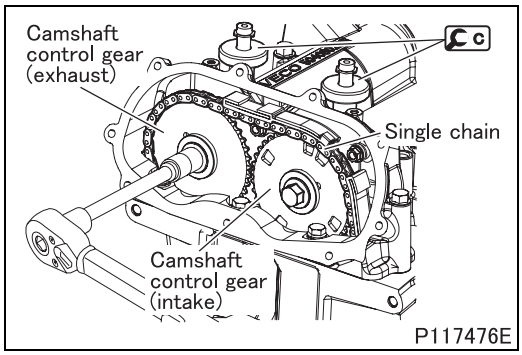
- A chain stretcher with self-locking mechanism needs to be replaced whenever it has been removed. The chain stretcher also needs to be replaced if the piston is inadvertently removed from the chain stretcher.
- Install the upper chain stretcher, and tighten it to a torque of 50 N·m {37 ft.lbs, 5.0 kgf·m}.
- Insert an appropriate screwdriver through the opening in the overhead and push the fin of the upper mobile skid until the piston of the upper stretcher reaches its stroke end.
- Check that tension is given to the chain when the piston is displaced from the seat.
- Then, confirm that chains A, B and C are taut. (Tighten each gear when the chains are taut.)



■ **Installation: Camshaft control gear (intake)**

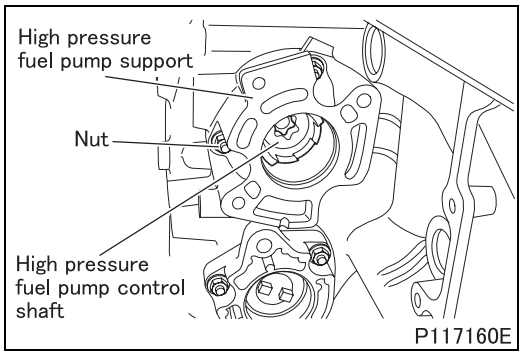
- Tighten the temporarily installed camshaft control gear (intake) to a torque of 110 N·m {81 ft.lbs, 11 kgf·m}.

https://truckmanualshub.com/

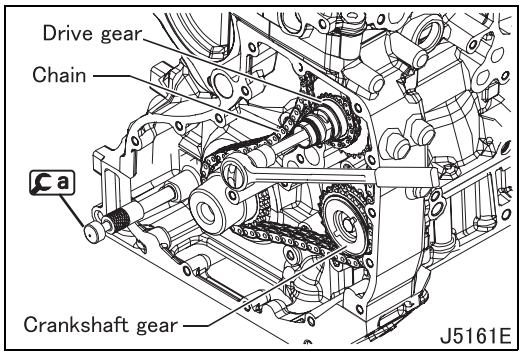


■ **Installation: Camshaft control gear (exhaust)**

- Tighten the temporarily installed camshaft control gear (exhaust) to a torque of 110 N·m {81 ft.lbs, 11 kgf·m}.
- After installation, confirm that the part of the chain between the exhaust and intake sides is taut.

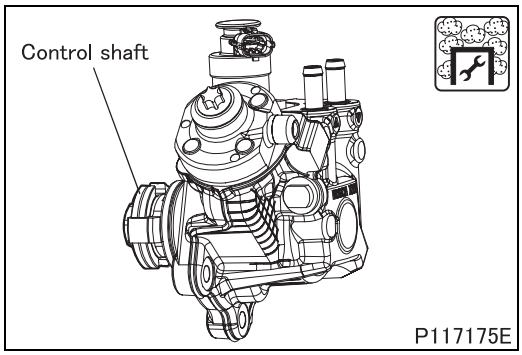


- Insert an appropriate wrench (T90 Torx bit socket) into the high pressure fuel pump control shaft to prevent the shaft from rotating.



■ **Installation: Drive gear**

- Confirm that the part of the single chain between the drive gear and the camshaft control gear is taut, then tighten the drive gear to a torque of 135 N·m {100 ft.lbs, 14 kgf·m}, and remove the a.

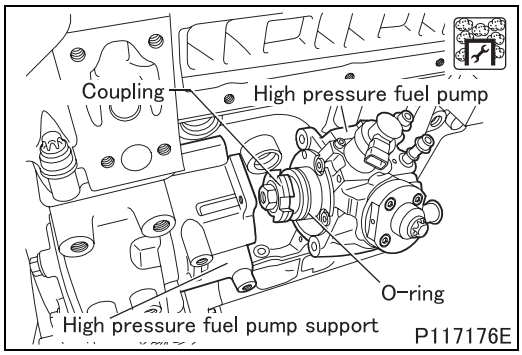


■ **Installation: High pressure fuel pump**

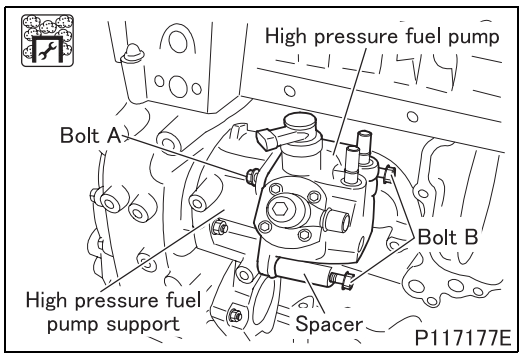
: This work requires protection against dust.

- The relative positions of the control shaft and pump axis are determined by the flange installed on the pump.
- The high pressure pump needs to be installed in a balanced position (bottom dead center), which is obtained by rotating the control shaft.
- Bosch provides a new high pressure pump in a stable and balanced position (bottom dead center) with the flange installed on the pump. Check that the pump shaft is unloaded (no tension).

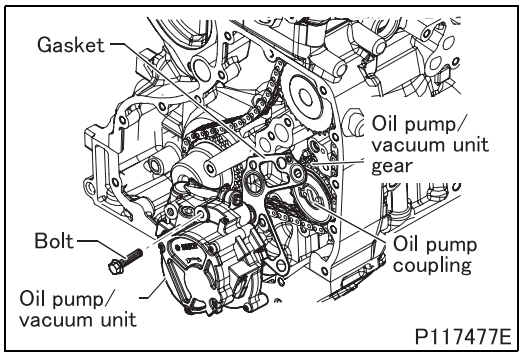
https://truckmanualshub.com/



- Apply engine oil to the O-ring, and then install the O-ring on the high pressure fuel pump.
- Be careful not to damage the O-ring when installing it.
- Install the pump so that the control shaft teeth are engaged with the coupling.
- Rotate the high pressure fuel pump (with the shaft and gear locked) to align the bolt holes in the high pressure fuel pump support and high pressure fuel pump.

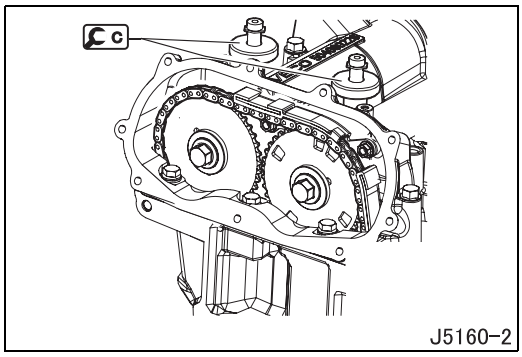


- Fully tighten mounting bolt A on the high pressure fuel pump support.
- Tighten two sets of bolt B and spacer.



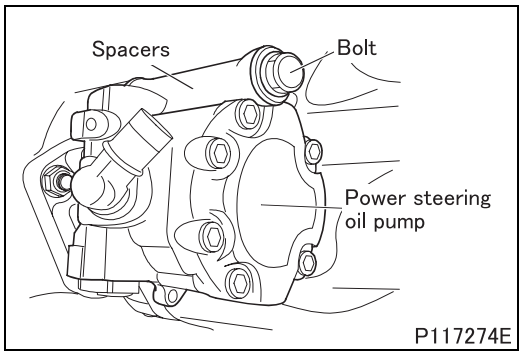
■ **Installation: Oil pump/vacuum unit**

- Install the oil pump coupling on the inner side of the oil pump/ vacuum unit gear.
- Insert a new gasket, and install the oil pump/vacuum unit.
- Screw in the bolts of the oil pump/vacuum unit, and confirm that the unit is installed correctly. Tighten the bolts to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



- Remove the C.

https://truckmanualshub.com/

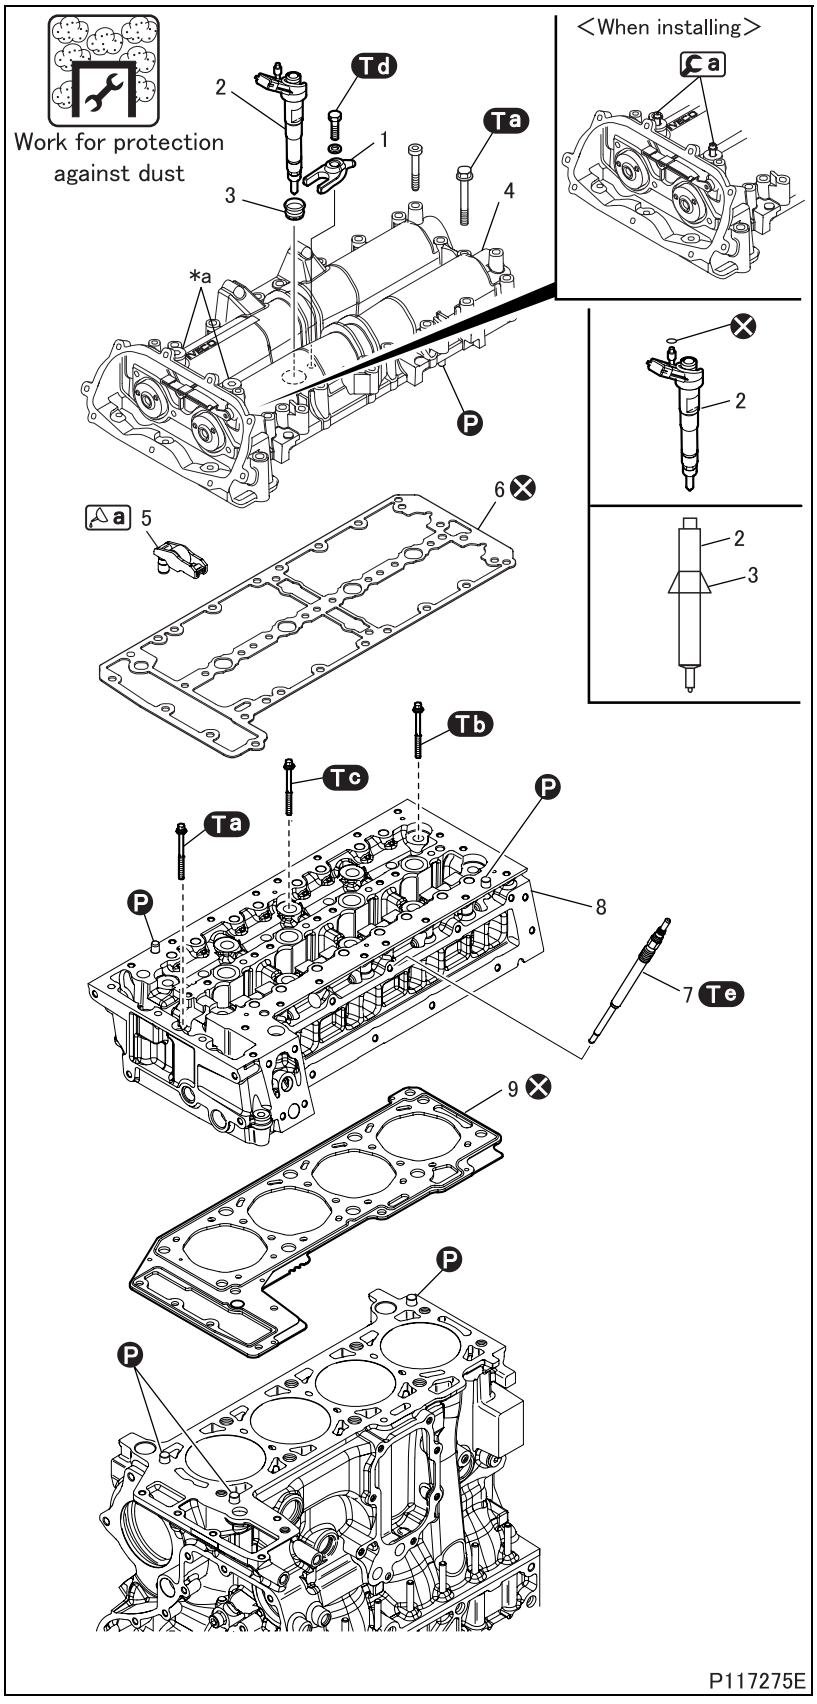


■ **Installation: Power steering oil pump**

- Apply engine oil to the O-ring, install the O-ring on the power steering oil pump, and then tighten the bolts of the power steering oil pump to a torque of 40 N·m {30 ft.lbs, 4.0 kgf·m}.

https://truckmanualshub.com/

OVERHEAD, CYLINDER HEAD



● Removal sequence

1. Injector bracket
2. Injector
3. Dust guard
4. Overhead (See later section.)
5. Rocker arm and hydraulic tappet
6. Gasket
7. Glow plug
8. Cylinder head (See later section.)
9. Cylinder head gasket

***a**: Lock plug
Ⓟ: Locating pin
⊗: Non-reusable parts

: This work requires protection against dust.

- If fine dust enters the high pressure fuel pump, engine performance will significantly be affected. Be sure to cover the openings after removing parts such as pipes.

● Installation sequence

Follow the removal sequence in reverse.

https://truckmanualshub.com/

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
5	Rocker arm and hydraulic tappet	Hydraulic tappet length	End of stroke	32.44 ± 0.3 {1.28 ± 0.012}	–	Replace
			Start of stroke	29.75 ± 0.25 {0.471 to 0.472}	–	Replace
		Outer diameter of hydraulic tappet		11.988 to 12.000 {0.471 to 0.472}	–	Replace
5, 8	Clearance between rocker arm and hydraulic tappet and seats on cylinder head			0.016 to 0.046 {0.00063 to 0.0018}	–	Replace

Te	Glow plug		8 to 10 {5.9 to 7.4, 0.8 to 1.0}	–

Lubricant and/or sealant

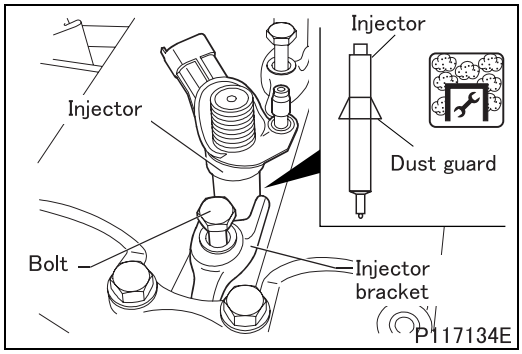
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Rocker arm and hydraulic tappet	Engine oil	As required

Special tools

Mark	Tool name and shape	Part No.	Application
a	Guide, camshaft  99360614	MH063968	Installation of overhead
b	Glow plug wrench  P116190	MH064216	Removal and installation of glow plug
c	Percussion puller  99340205	MH063990	Removal of injector

https://truckmanualshub.com/

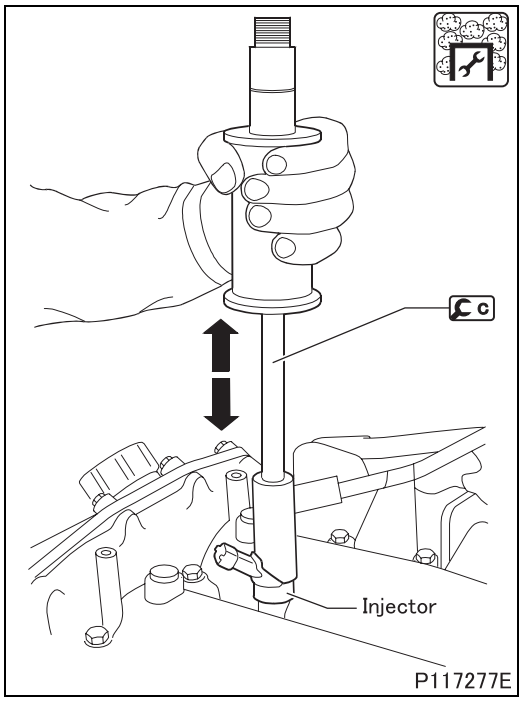
◆Removal procedure◆



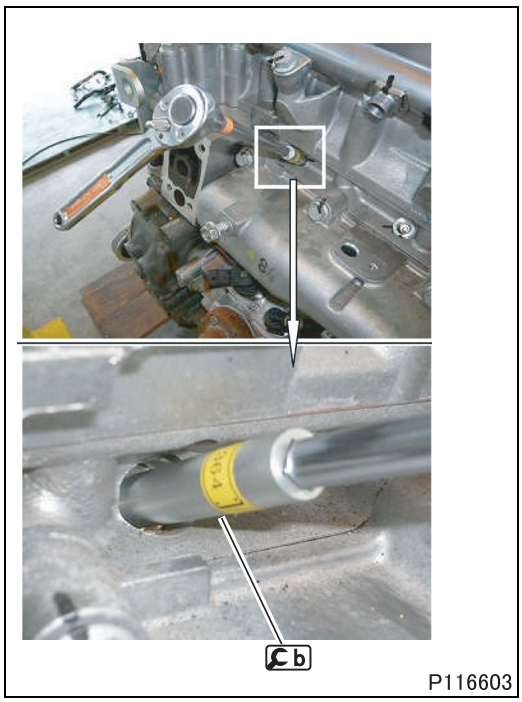
■ Removal: Injector

: This work requires protection against dust.

- Remove the injector bracket.



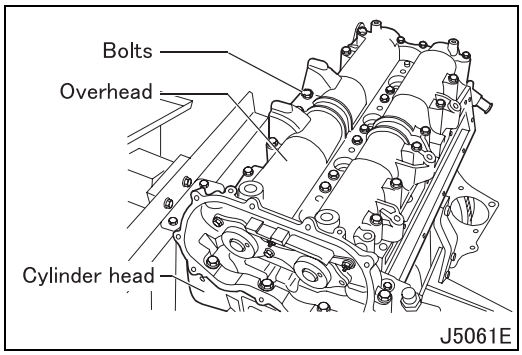
- Using the c, remove the injector from the engine overhead. (The injector is of a direct sealing type, so it does not use a gasket.)



■ Removal: Glow plug

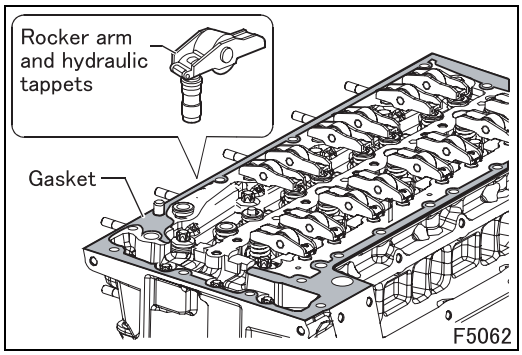
- Using the b, remove the glow plug from the cylinder head.

https://truckmanualshub.com/



■ **Removal: Overhead**

- Remove the bolts and detach the overhead from the cylinder head.

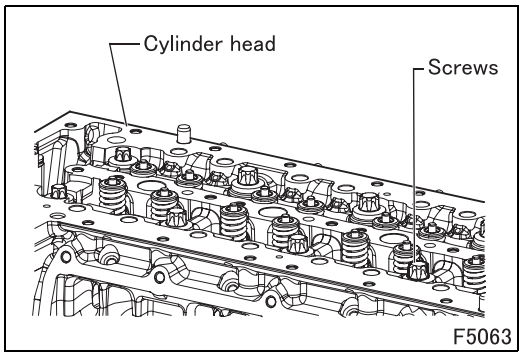


■ **Removal: Rocker arm and hydraulic tappet**

- Remove the rocker arm and the hydraulic tappets.
- Remove the gasket.

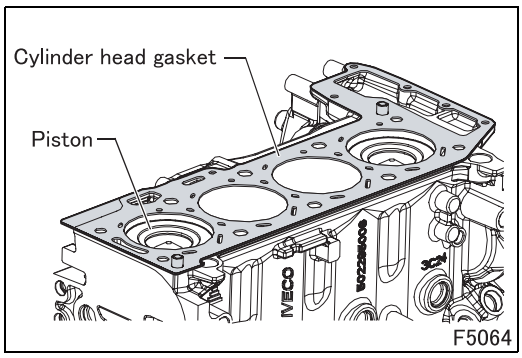
NOTE

- **Tappets must be marked for position if they are going to be reused.**



■ **Removal: Cylinder head**

- Remove the screws and remove the cylinder head.

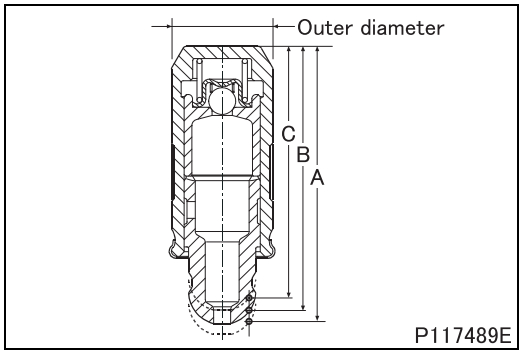


■ **Removal: Cylinder head gasket**

- Remove the cylinder head gasket.
- Check the protrusion of the pistons as described under the relevant heading to check the possibility of facing the crankcase if it has deformed.

https://truckmanualshub.com/

◆Inspection procedure◆



■ Inspection: Rocker arm and hydraulic tappet

(1) Visual inspection

- The sliding surface of the tappets must have no scoring/dents; replace them if they do.

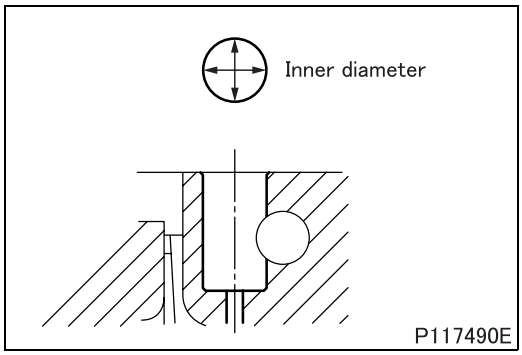
(2) Hydraulic tappet length

- Measure the each length of hydraulic tappet for the end and start of stroke.
  A = 32.44 ± 0.3 mm {1.28 ± 0.012 in.}, end of stroke
  B = 31.30 mm {1.23 in.}, working position: reference
  C = 29.75 ± 0.25 mm {1.17 ± 0.0098 in.}, start of stroke

- If the measurement is not within the standard valve range, replace the hydraulic tappet.

(3) Outer diameter of hydraulic tappet

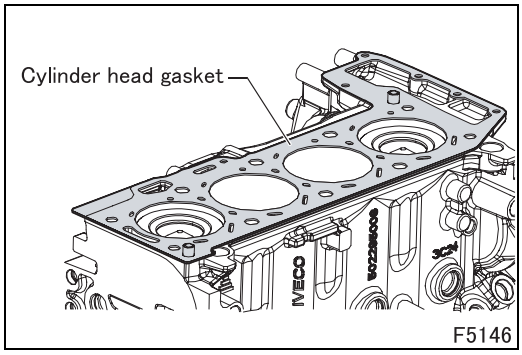
- If the measurement is not within the standard valve range, replace the hydraulic tappet.



■ Inspection: Inner diameter of seats on cylinder head for hydraulic tappet

- If the measurement is not within the standard value range, replace the cylinder head.

◆Installation procedure◆



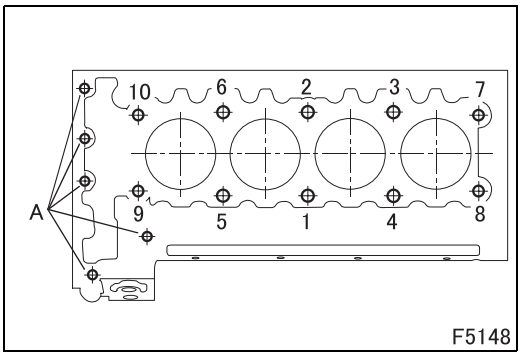
■ Installation: Cylinder head gasket

- Check that the mating surfaces of the cylinder head and crankcase are clean.
- Keep the cylinder head gasket clean.
- Place the cylinder head gasket of the cylinder head with the thickness given in section “Check piston protrusion”, with the “TOP” sign facing the head.

NOTE

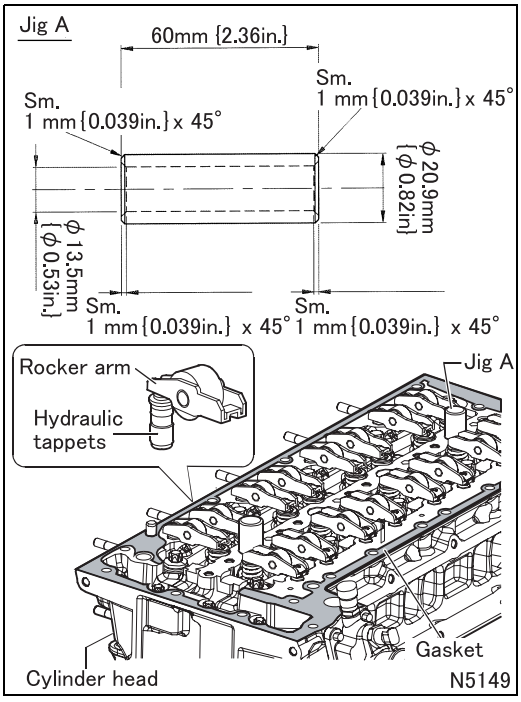
- **It is essential to keep the cylinder head gasket sealed in its package until just before assembly.**

https://truckmanualshub.com/



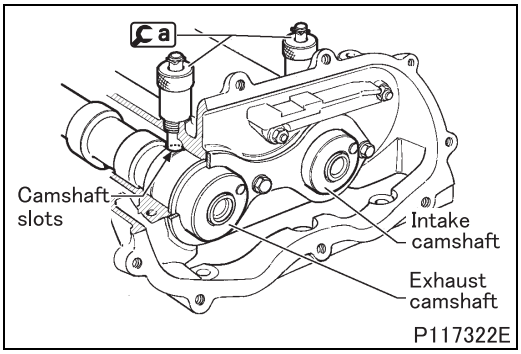
■ **Inspection: Cylinder head**

- Mount the cylinder head.
- Apply engine oil to the threads of the cylinder head bolts and install the bolts, and then tighten them in three phases as follows in the order shown in the drawing.
- Diagram of the tightening sequence for the cylinder head fixing bolts.
  - **1st phase**: pre-tightening with torque wrench
    - Bolts 1-2-3-4-5-6 to a torque of 130 N·m {96 ft.lbs, 13 kgf·m}.
    - Bolts 7-8-9-10 to a torque of 65 N·m {48 ft.lbs, 6.6 kgf·m}.
  - **2nd phase**: angle closing
    - Bolts 1-2-3-4-5-6 90°.
    - Bolts 7-8-9-10 90°.
  - **3rd phase**: angle closing
    - Bolts 1-2-3-4-5-6 90°.
    - Bolts 7-8-9-10 60°.
  - Bolts A, to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



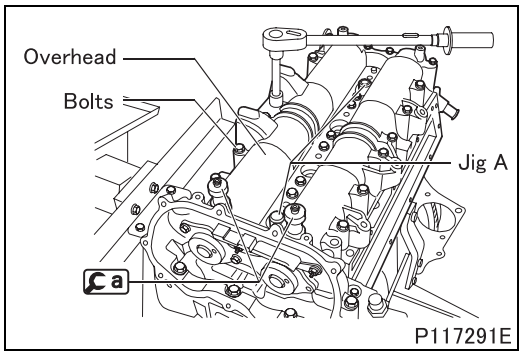
■ **Installation: Rocker arm and hydraulic tappet, overhead**

- Make a fixture jig A as shown in the illustration.
- Thoroughly clean the hydraulic tappets, lubricate them and fit them in the cylinder head, positioning the rocker arms on the valves correctly.
- Install the gasket.
- Insert the two jigs into the injector seats for subsequent centering of the overhead on the cylinder head.

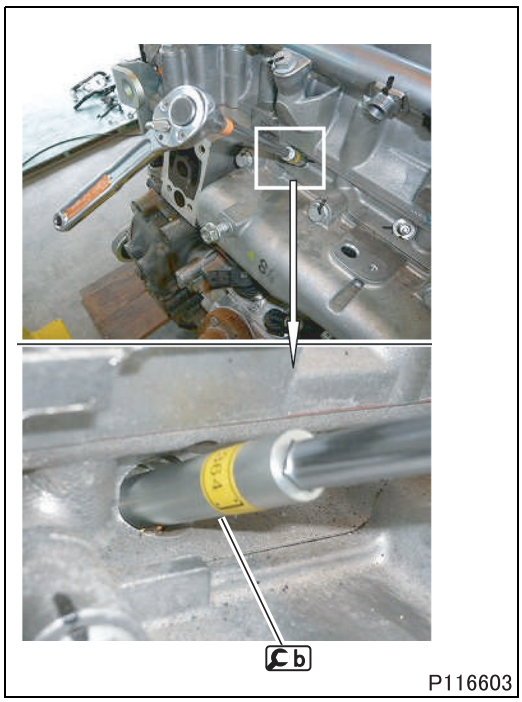


- Position the camshafts so that the Ca can be inserted in the camshaft slots through the overhead threaded holes.

https://truckmanualshub.com/

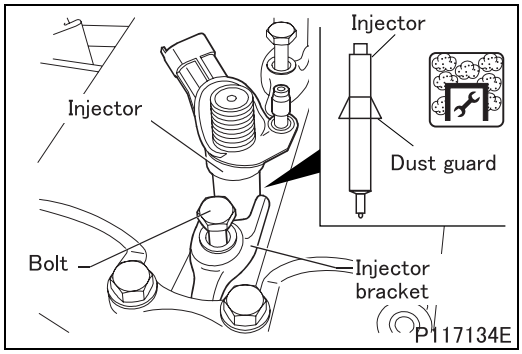


- Mount the overhead together with the a for the timing and tighten the fixing bolts to the prescribed torque: 25 N·m {18 ft.lbs, 2.5 kgf·m}.
- Take out the jig A.



■ **Installation: Glow plug**

- Using the b, install the glow plug on the cylinder head using a torque of 8 to 10 N·m {5.9 to 7.4 ft.lbs, 0.8 to 1.0 kgf·m}.



■ **Installation: Injector**

: This work requires protection against dust.

- Install a new dust guard on the injector.
- Install the injector on the overhead.
- Install the injector bracket.
- Install the bolt without tightening it.
- After installing the fuel pipes to the injector and to the common rail, tighten the injector bracket mounting bolt to the prescribed torque: 32 N·m {24 ft.lbs, 3.3 kgf·m}.

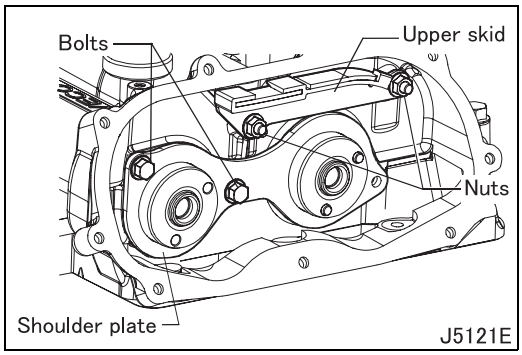
	Nut (upper skid mounting)		
	Bolt (shoulder plate mounting)		

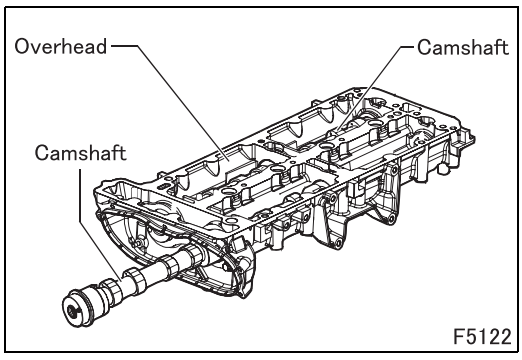
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Support pin of the camshaft	Engine oil	As required

◆Removal procedure◆



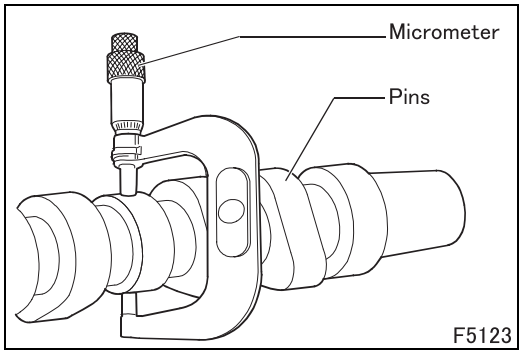
- Remove the nuts and the upper skid. Remove the bolts and the shoulder plate.

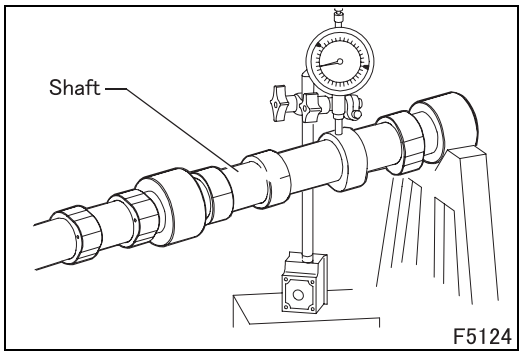


- Tilt the overhead and take care not to damage the seats, then remove the camshafts from the overhead.

https://truckmanualshub.com/

◆Inspection procedure◆





■ Inspection: Camshaft and overhead

(1) Camshaft pin-to-overhead supporting seat clearance

- The surfaces of the shaft supporting pins and of the cams must be finely honed; if there is any sign of wear or scoring, replace the shaft.
- Using a micrometer, measure the diameter of the pins of the camshaft and, using a bore meter, measure the diameter of the supporting seats in the overhead.
- The difference between these two measurements gives the existing clearance.
  The nominal assembly clearance is 0.032 to 0.087 mm {0.0013 to 0.0034 in.}.

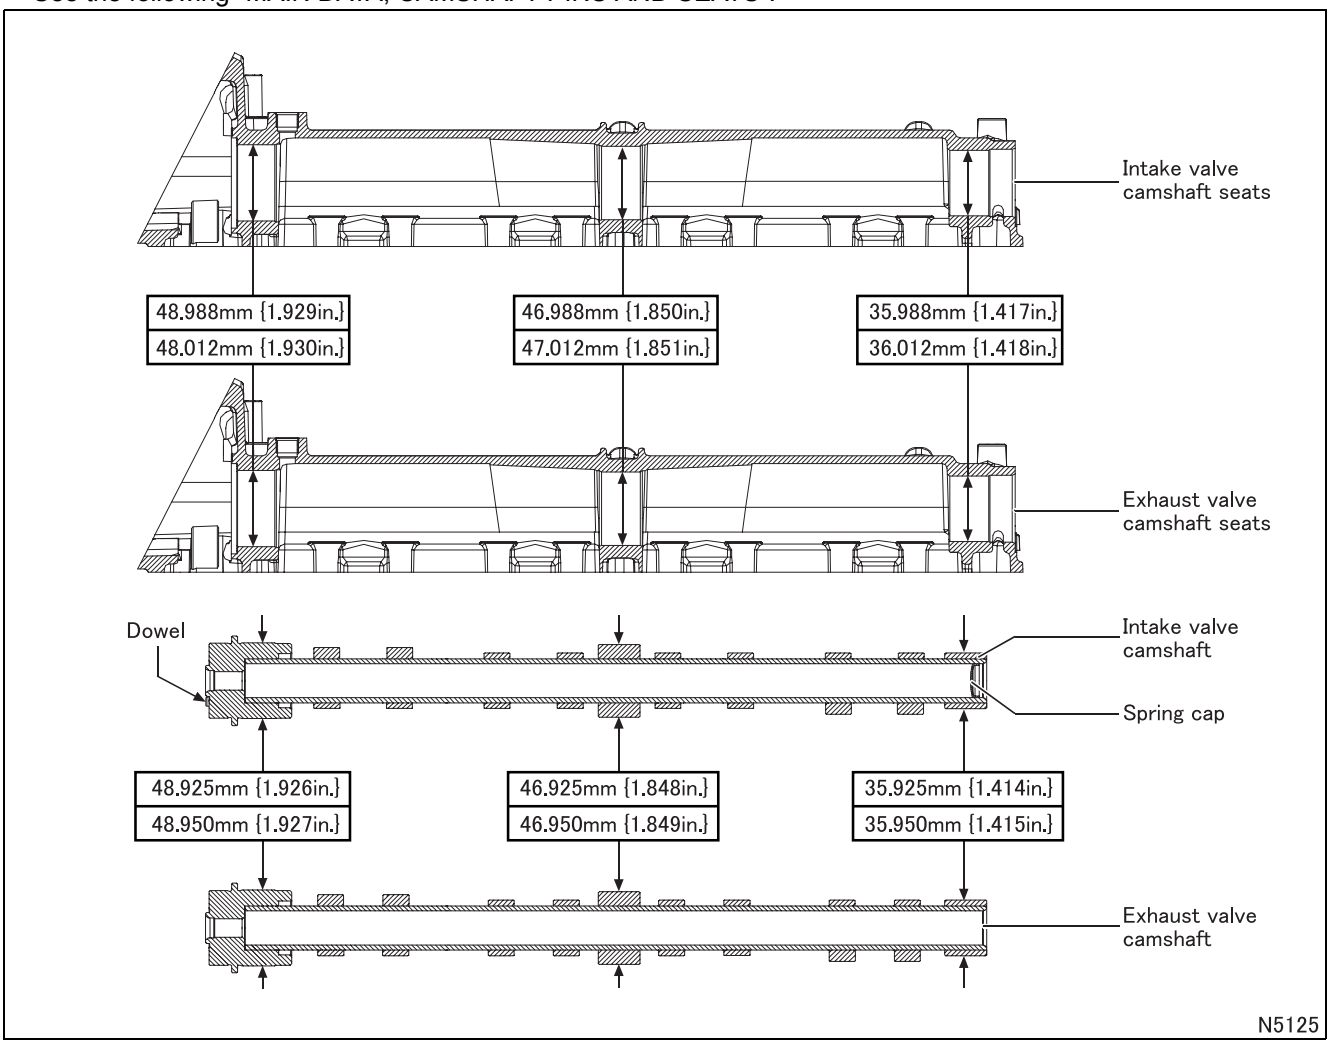
(2) Camshaft useful cam lobe height and bend

- Place the shaft on the V-blocks and use a dial gauge fitted on the central support to check that the bend does not exceed 0.04 mm {0.0016 in.}; otherwise, change the shaft.
- Check also the useful camshaft lobe height: it must correspond to the standard value; if different values are detected, change the shaft.

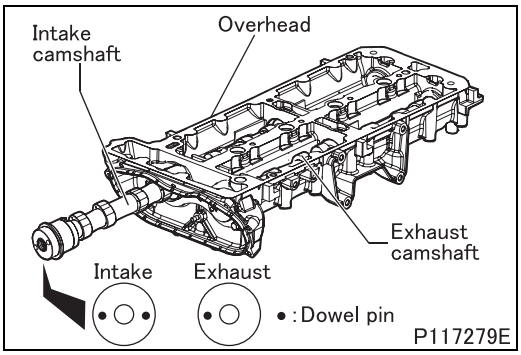
https://truckmanualshub.com/

OVERHEAD, CYLINDER HEAD

- See the following “MAIN DATA, CAMSHAFT PINS AND SEATS”.

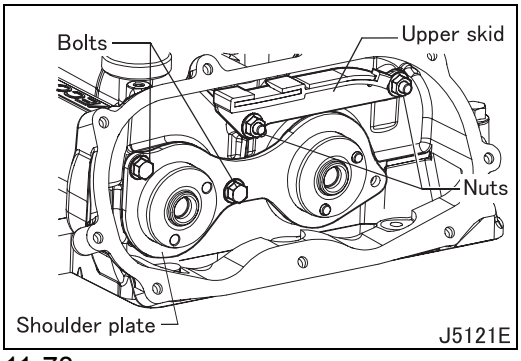


◆Installation procedure◆



■ Installation: Camshaft

- Apply engine oil to the support pins of the intake camshaft and exhaust camshafts, and install the camshaft on the overhead.
- During this work, do not change over the mounting positions of the shafts.
  The intake camshaft can be identified by the number of dowel pins on the front face. (intake: 2 dowel pins, exhaust: 1 dowel pin) Be careful not to damage the support seat of the overhead shaft.



- Install the upper skid using a tightening torque of 10 N·m {7.4 ft.lbs, 1.0 kgf·m}.
- Install a new shoulder plate using a torque of 10 N·m {7.4 ft.lbs, 10 kgf·m}.

https://truckmanualshub.com/

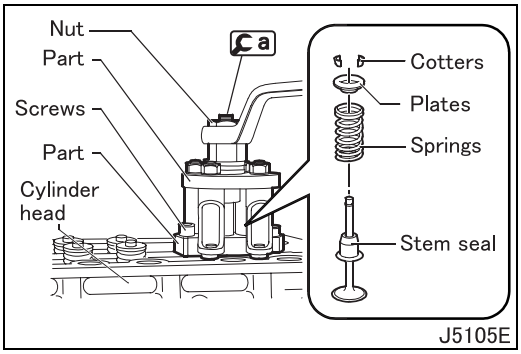
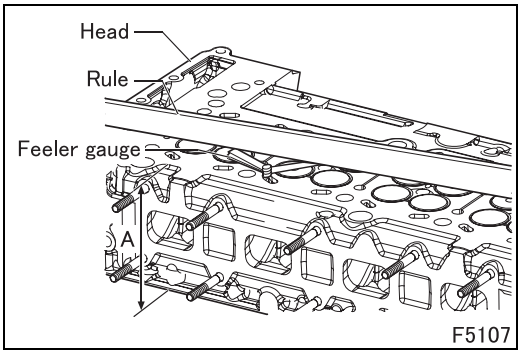
◆Removal procedure◆



■ Removal: Valve

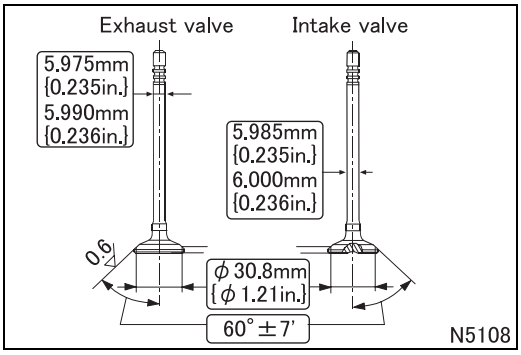
- Install part of a onto the cylinder head and secure it with the screws.
- Install part of a onto part, screw down the nut so that on compressing the springs it is possible to remove the cotters. Then take out the plates and the springs.
- Using suitable pliers, remove the stem seal.
- Repeat these operations on the remaining valves.
- Turn the cylinder head over.

◆Inspection procedure◆



■ Inspection: Cylinder head deformation of mating surface

- The mating surface of the head with the cylinder block is checked using a rule and a feeler gauge.
- The deformation found on the entire length of the cylinder head must be no greater than 0.2 mm {0.0079 in.}.
- The nominal thickness A of the cylinder head is 112 ± 0.1 mm {4.41 ± 0.0039 in.}; the maximum permissible removal of metal must not exceed a thickness of 0.2 mm {0.0079 in.}.
- After regrinding, check the valve recessing and if necessary regrind the valve seats to make the prescribed valve recessing.



■ Inspection: Intake valve, exhaust valve

(1) Visual inspection

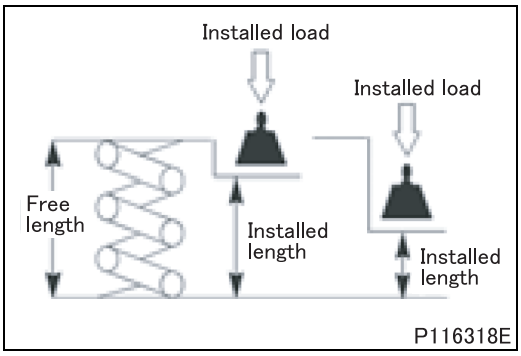
- Remove the carbon deposits on the valves with a wire brush. Check that the valves show no signs of seizure, cracking or burning.

(2) Stem outside diameter

- Replace the valve stem if the measured value is not within the standard value range.

(3) Valve seat angle

- Replace the valve seat if the measured value is not within the standard value range.



■Inspection: Valve spring

(1) Free length

Standard value: 55.05 mm {2.17 in.}

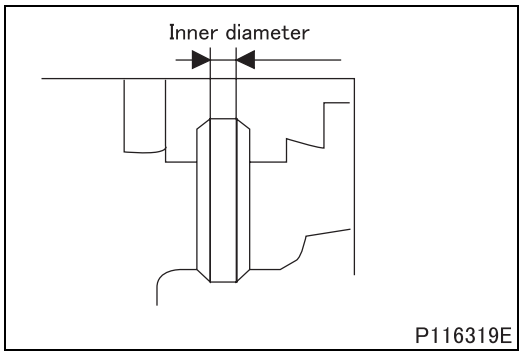
- If the measurement is out of the standard value, replace the valve spring.

(2) Installed load (installed length)

Standard value: 45 mm {1.77 in.} 320 ± 16 N {72 ± 3.6 lbs, 32.6 ± 1.6 kgf}
: 35 mm {1.38 in.} 657 ± 30 N {145 ± 6.7 lbs, 67.0 ± 3.1 kgf}

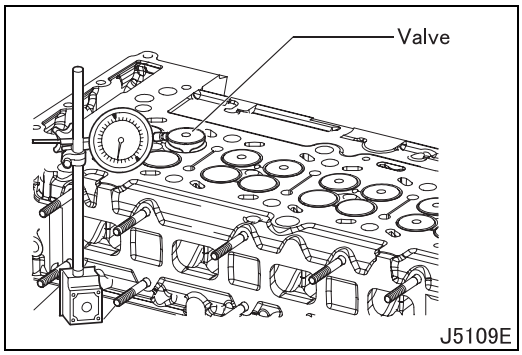
- If the measurement is out of the standard value, correct the valve.

https://truckmanualshub.com/



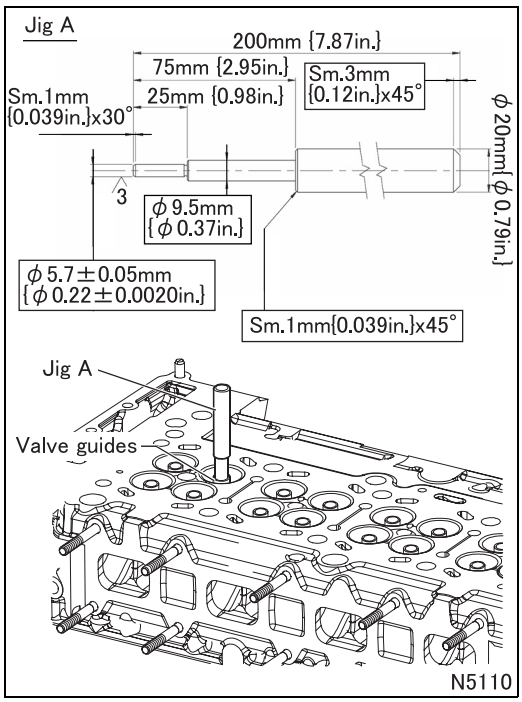
■**Inspection: Valve guide inner diameter**

- Measure the valve guide inner diameter using a small hole diameter gauge.
  Standard value: 6.023 to 6.038 mm {0.237 to 0.238 in.}
- If the measurement is out of the standard value, replace the valve guide.



■ **Inspection: Clearance between valve stem and valve guide and centering valves**

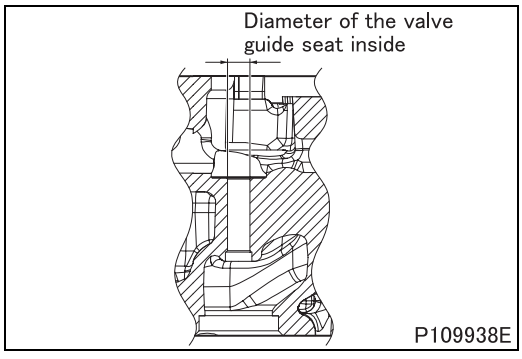
- The checks are made using [C] with a magnetic base, positioned as illustrated.
- The assembly clearance is 0.033 to 0.063 mm {0.0013 to 0.0025 in.}.
  Rotate the valve, check that the centering error is no greater than 0.03 mm {0.0012 in.}.
- If measurement is not within the standard value range or exceeds the limit, replace the defective parts.



■ **Replacement of valve guide**

[Removal]

- Make the fixture jig A as shown in the illustration.
- Remove the valve guides with the drift jig A.



[Installation]

- Measure the diameter of the valve guide seat inside in the cylinder head.

Standard value of valve guides–Seats

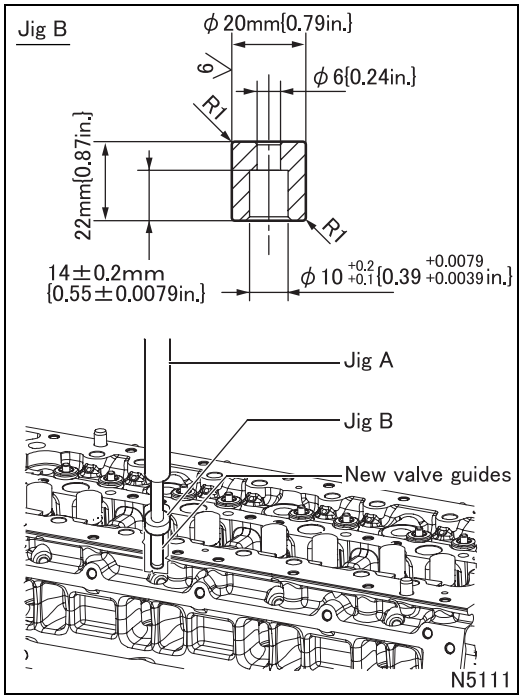
Valve guide seat inside φ	9.980 to 10.000 mm {0.393 to 0.394 in.}
Valve guide outside φ	10.028 mm to 10.039 mm {0.394 to 0.395 in.}

https://truckmanualshub.com/

- If the measurement is not within the standard value, select an oversized valve guide from the table below.
- Recondition the valve guide mounting hole to the diameter corresponding to the diameter of the selected oversized valve guide.

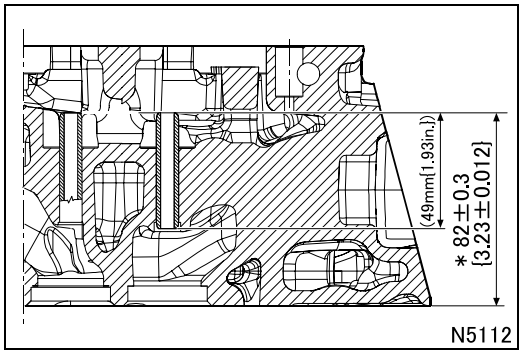
Unit: mm {in.}

Available oversize	0.05 {0.002}	0.1 {0.0039}	0.25 {0.0098}
Valve guide outside diameter	10.078 to 10.089 {0.396 to 0.397}	10.128 to 10.139 {0.398 to 0.399}	10.278 to 10.289 {0.404 to 0.405}



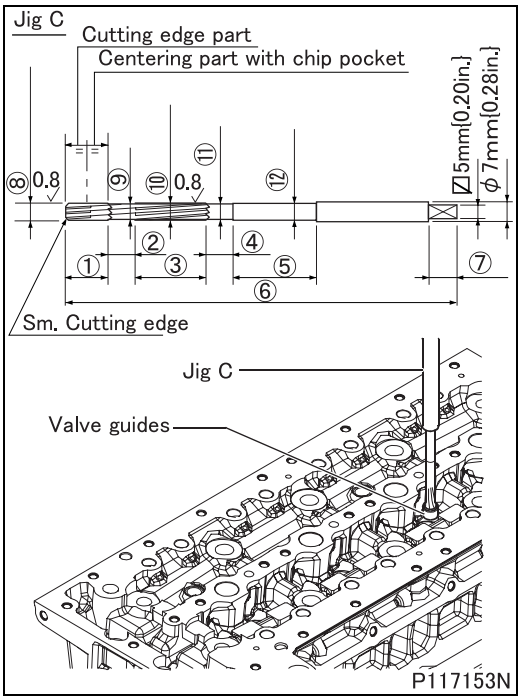
- Make the fixture jig B as shown in the illustration.
- Warm up the cylinder head to 80 to 100°C {176 to 212°F} and, by means of beater jig A fitted with element jig B, fit the new valve guides previously lubricated with engine oil. Driving force 4.2 to 12 kN {945 to 2700 lbs, 430 to 1250 kgf}.

- Measurement to be made after driving in the valve guides.



- If the above mentioned tools are not available, fit the valve guides by positioning them in the cylinder head according to the value shown in figure.

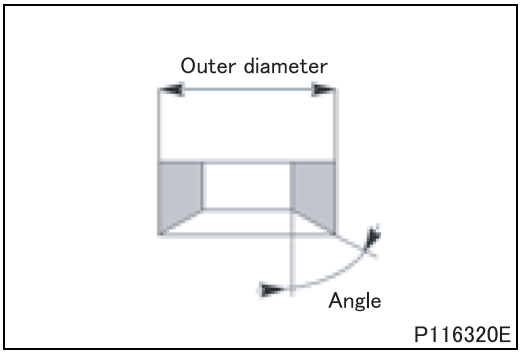
https://truckmanualshub.com/



Refacing the valve guide

- Make the fixture jig C as shown in the illustration.
- After driving in the valve guides, regrind them with the smoother jig C.

(1) 15 mm {0.59 in.}
(2) 10 mm {0.39 in.}
(3) 25 mm {0.98 in.}
(4) 10 mm {0.39 in.}
(5) 30 mm {1.18 in.}
(6) 140 mm {5.51 in.}
(7) 10 mm {0.39 in.}
(8) ϕ5.9 ± 0.05 mm {0.23 ± 0.0020 in.}
(9) ϕ5.5 mm {0.22 in.}
(10) $6.03\ ^{+0}_{+0.005}$ mm {$0.24\ ^{+0}_{+0.00020}$ in.}
(11) ϕ5.5 mm {0.22 in.}
(12) ϕ5.95 mm {0.24 in.}



■Inspection: Valve seat (when replaced with a new part)

(1) Outer diameter

Standard value: 34.595 to 34.610 mm {1.362 to 1.363 in.}

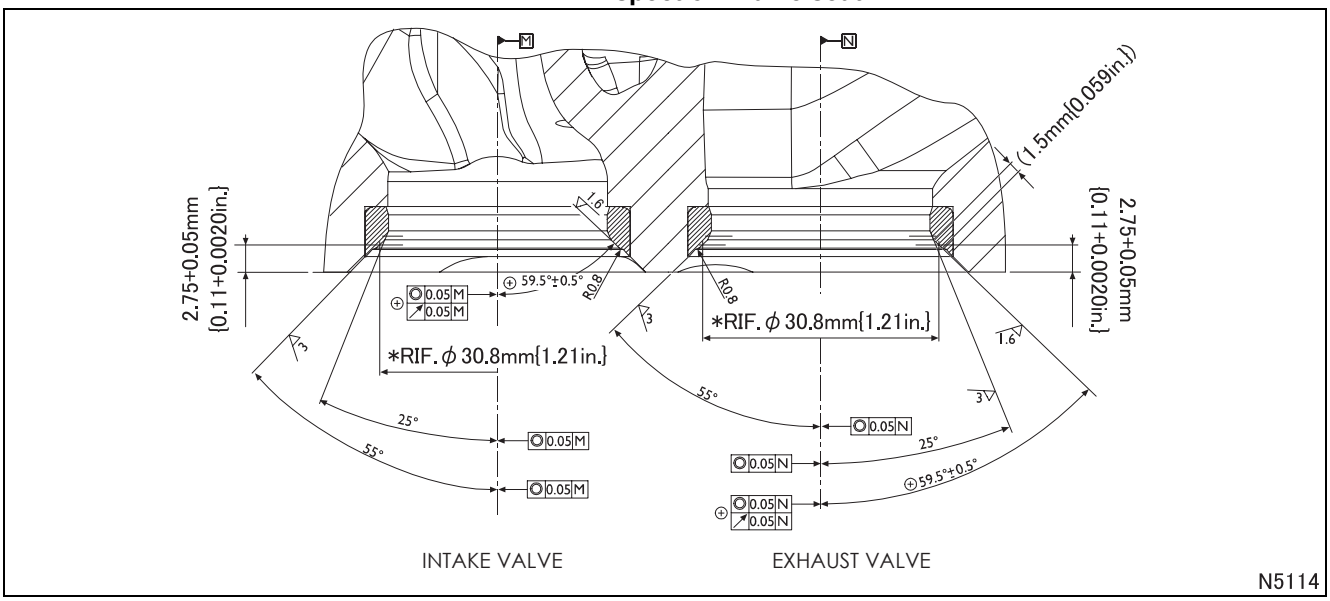
- If the measurement is out of the standard value, replace the valve seat.

(2) Angle

Standard value: 59.5 ± 0.5°

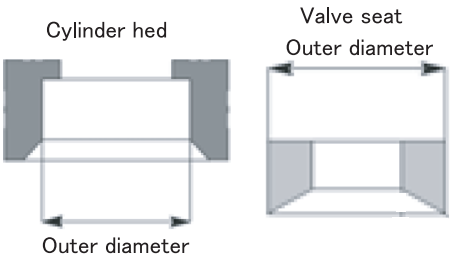
- If the measurement is out of the standard value, replace the valve seat.

■ Inspection: Valve seat



https://truckmanualshub.com/

- Check the valve seats. On finding any slight scoring or burns, regrind them with an appropriate tool according to the angles given in figure.
- Having to replace them, with the same tool and taking care not to affect the cylinder head, remove as much material from the valve seats as possible until, with a punch, it is possible to extract them from the cylinder head.
- Heat the cylinder head to 80 to 100°C {176 to 212°F} and, using a suitable drift, fit in it the new valve seats, previously chilled in liquid nitrogen.
- Using a specific tool, regrind the valve seats according to the angles given in figure.
- Mount the valves, block the seat of the electro-injectors and glow plugs; using a suitable tool, check the seal of the valves/seats.

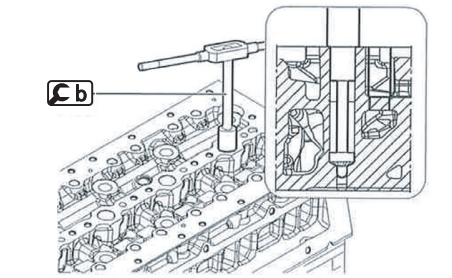


P116321E

■**Clearance between valve seat and cylinder head**

Standard value: 0.08 to 0.12 mm {0.0031 to 0.0047 in.}

- If the measurement is out of the standard value, replace defective parts.



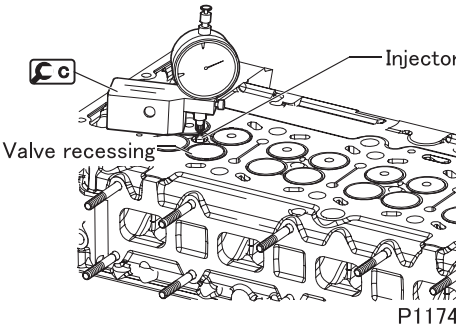
116333

■**Inspection: Injector support seat**

- Check the injector support seat for carbon deposits.
- If carbon deposits are present, clean the injector support seat using b.

CAUTION ⚠

- **Never grind the aluminum surface of the injector support seat.**



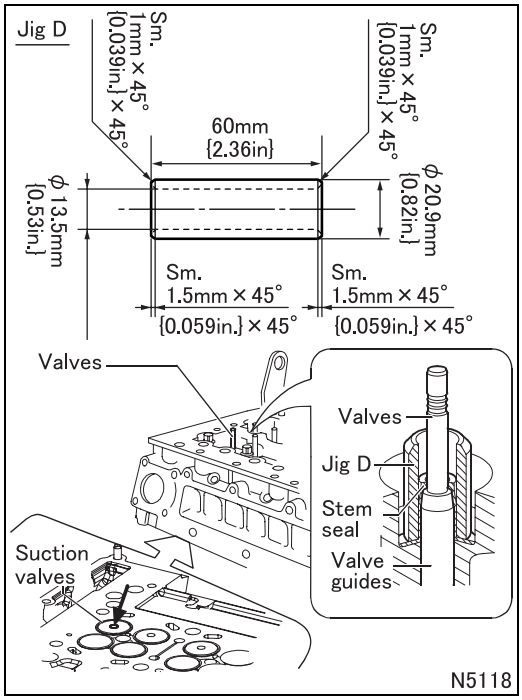
P117412E

■ **Inspection: Valve recessing, protrusion of injector and glow plug**

- Using dial gauge and relevant base c, check that, from the plane of the cylinder head, the valve recessing and the protrusion of the injector and of the glow plug have the prescribed value.
  - Valve recessing: 0.475 to 0.5250 mm {0.019 to 0.021 in.}
  - Injector protrusion: –0.10 to +0.20 mm {–0.0039 to 0.0079 in.}
  - Glow plug protrusion: 3.77 ± 0.30 mm {0.15 ± 0.012 in.}
- If the measurement is not within the standard value range, replace the defective parts.

https://truckmanualshub.com/

◆Installation procedure◆

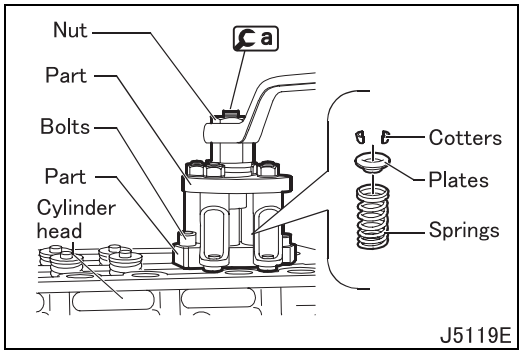


■ **Installation: Valve**

- Make a fixture jig D as shown in the illustration.
- Lubricate the stem of the valves and insert them into the associated valve guides according to the position marked during removal. Using jig D, mount the stem seals on the valve guides.

NOTE

- **The intake valves are different from the exhaust ones for a dimple (→) in the center of the valve head.**



- Position the springs and plates on the cylinder head.
- Install the part of a onto the cylinder head and secure it with the screws.
- Install the part of a onto part, screw down the nut so that by compressing the springs it is possible to insert the retaining cotters; then unscrew the nut checking that the cotters have settled in correctly.
- Repeat these operations on the remaining valves.

◆Removal procedure◆

■ **Removal: Piston and connecting rod**

- Before removing the piston, remove carbon deposits from the inside of the cylinder so as to prevent the piston walls from becoming damaged.
- Set the piston and connecting rod assembly to the bottom dead center.
- Loosen the connecting rod cap, and rotate the engine in the vertical position.
- Remove the connecting rod cap and the lower connecting rod bearing.

CAUTION ⚠

- **After removing the connecting rod cap, be sure to place the connecting rod cap and the connecting rod bearing with their sides facing downward. If you place them with the end face downward, the connecting rod bearing assembly will be damaged. If damage occurs, it will be necessary to replace the connecting rod assembly.**

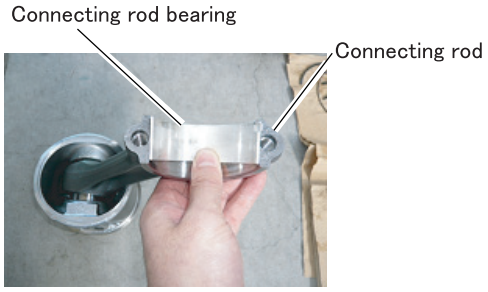
- Withdraw the piston and the connecting rod assembly from the top of the crankcase.
- Next, install the connecting rod cap and the lower connecting rod bearing on the connecting rod. During this work, confirm that there is no foreign matter on the mating faces.

CAUTION ⚠

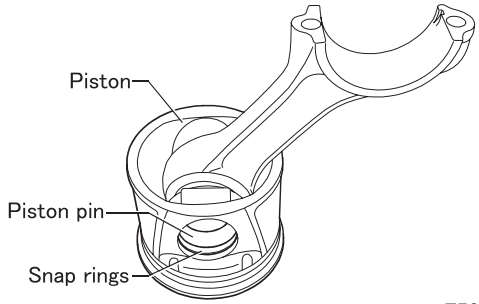
- **After removing a piston and its connecting rod assembly, install the connecting rod cap and the bearing on the same connecting rod before removing a different connecting rod cap. During this work, ensure that no clearance occurs between the mating face to prevent these faces from being damaged.**

https://truckmanualshub.com/

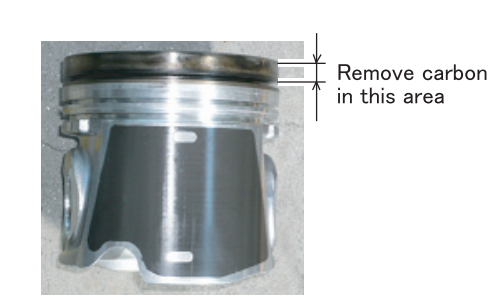
- Because it is necessary to re-install all of the component parts in their original locations, make a note of the cylinder number and the front and rear directions of the engine on each connecting rod and the connecting rod cap before removing these parts. Also, after removing a connecting rod cap, make a mark using a scriber on the notch of the bearing shell to identify top and bottom, and also indicate the cylinder number.



- Push the connecting rod bearing from the side, and remove the bearing from the connecting rod.



- Hold the piston with the top facing downward, and place the piston on a table.
- Using snap ring pliers, remove the snap ring from the piston.
- Slide the piston pin and remove it, then remove the connecting rod from the piston.
- Using piston ring pliers, remove the 1st ring and 2nd ring from the piston.
- Remove the oil ring by hand, and then pull out the joint core wire and remove the oil expander spring remaining on the piston side.

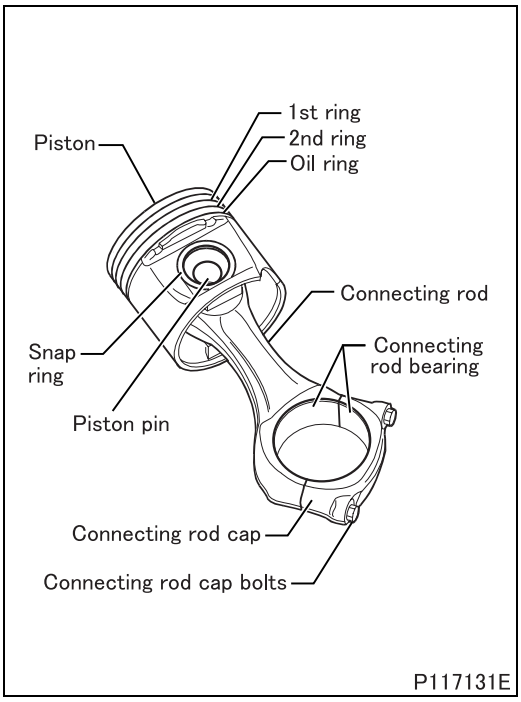


- Remove the carbon in the area shown in the drawing from the removed pistons using a carbon scraper and steel scrubbing brush.

https://truckmanualshub.com/

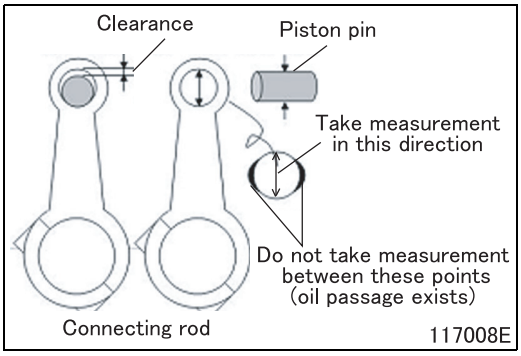
PISTON AND CONNECTING ROD

◆Inspection procedure◆



■ Inspection: Piston and connecting rod

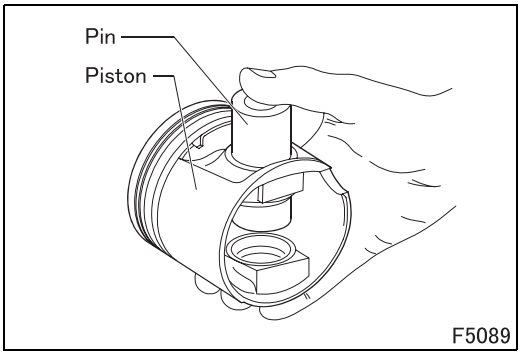
- Check the pistons. They must show no signs of seizure, scoring, cracking or excessive wear; replace them if they do.



■ Inspection: Clearance between piston pin and connecting rod bushing

Standard value: 0.014 to 0.030 mm {0.00055 to 0.0012 in.}

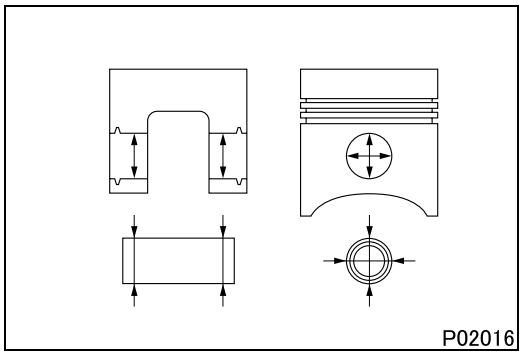
- If the measurement is out of the standard value, replace the bushing.



■ Inspection: Piston pin

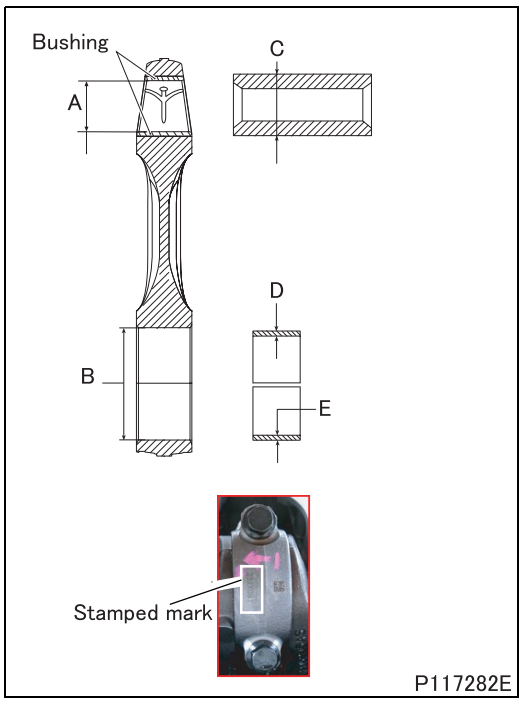
- Lubricate the pin and its seat on the hubs of the piston with engine oil. The pin must go into the piston by lightly pressing with the fingers and must not drop out by gravity.
- If the pin drops out by gravity, replace the defective part.

https://truckmanualshub.com/



P02016

- Clearance between piston pin and piston
  Standard value: 0.07 to 0.019 mm {0.0028 to 0.00075 in.}
  - If the measurement is out of the standard value, replace defective parts.



P117282E

■ **Inspection: Connecting rod and bearing**

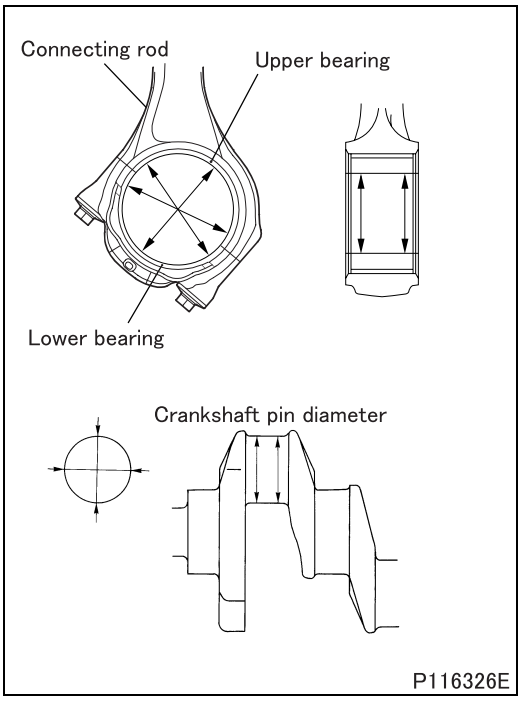
Standard value: A = 36.010 to 36.020 mm {1.417 to 1.418 in.}
B = 67.833 to 67.848 mm {2.670 to 2.671 in.}
C = 35.990 to 35.996 mm {1.416 to 1.417 in.}
D = 1.882 to 1.892 mm {0.074 to 0.0745 in.}
E = 1.878 to 1.888 mm {0.073 to 0.074 in.}

- If the measurement is out of the standard value, replace defective parts.
- Tighten the connecting rod cap bolt to a torque of 50 N·m {37 ft.lbs, 5.0 kgf·m} when measuring dimension B.

- Each connecting rod has its cap marked with the followings.
  - A number indicating the weight class of the connecting rod mounted in production.
  - A letter: O or X indicating the diameter class of the big end mounted in production.
- In addition, it could be stamped with the number of the cylinder in which it is fitted.
  In the event of replacement it is therefore necessary to number the new connecting rod with the same number as the one replaced.
- The numbering must be done on the opposite side to the bearing shell retaining slots.
  The connecting rods are supplied as spare parts with the diameter of the big end 67.833 to 67.848 mm {2.670 to 2.671 in.} marked with the letter O and the weight class marked with the number 33.
- It is not permissible to remove material.
- Connecting rods assembled on one engine must be of the same class and the same supplier.

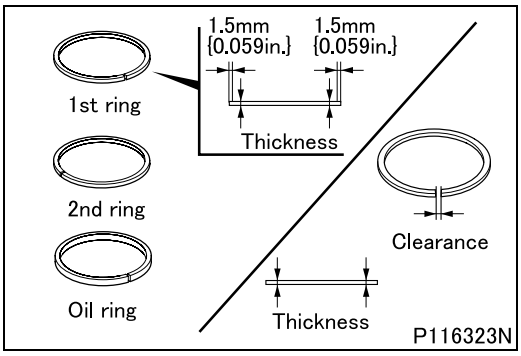
- Check that the bushing in the small end has not come loose and shows no sign of seizure or scoring. If it does, replace the complete connecting rod.

https://truckmanualshub.com/



■**Inspection: Clearance (oil clearance) between connecting rod bearing (big end) and crankshaft**

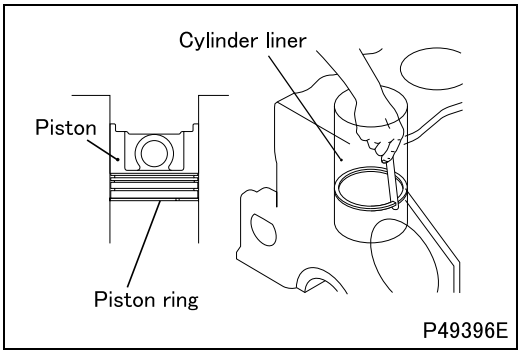
- Tighten the connecting rod cap bolt to a torque of 50 N·m {37 ft.lbs, 5.0 kgf·m} when measuring the clearance.
- For the measuring method and standard value of the crankshaft, see CRANKSHAFT AND CRANKCASE.
- Measure the inner diameter of the bearing and the outer diameter of the crankshaft pin to determine the oil clearance.
  Standard value: 0.035 to 0.083 mm {0.0014 to 0.0033 in.}
- If the measurement is out of the standard value, replace defective parts.



■**Inspection: Piston ring**

Standard value	1st ring	*Thickness	2.068 to 2.097 mm {0.081 to 0.083 in.}
		Clearance	0.20 to 0.35 mm {0.0079 to 0.014 in.}
	2nd ring	Thickness	1.970 to 1.990 mm {0.077 to 0.078 in.}
		Clearance	0.060 to 0.80 mm {0.024 to 0.031 in.}
	Oil ring	Thickness	2.470 to 2.495 mm {0.097 to 0.098 in.}
		Clearance	0.30 to 0.60 mm {0.012 to 0.024 in.}

- * Measure the 1st ring in the position shown in the drawing.
- If the measurement is out of the standard value, replace the piston ring.



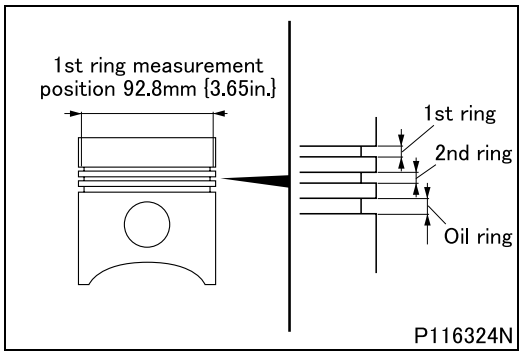
■**Inspection: Piston ring end gap**

- Using the piston head, insert the piston ring into the crankcase cylinder while keeping the ring level. The piston ring should be inserted to the lower part where cylinder wear is small.
- Measure the piston ring end gap while taking care not to allow the ring to move.

Standard value	*1st ring	0.103 to 0.162 mm {0.0041 to 0.0064 in.}
	2nd ring	0.060 to 0.100 mm {0.0024 to 0.0039 in.}
	Oil ring	0.045 to 0.090 mm {0.0018 to 0.0035 in.}

- If any of the measurements is out of the standard value, replace the piston rings as a set.

https://truckmanualshub.com/

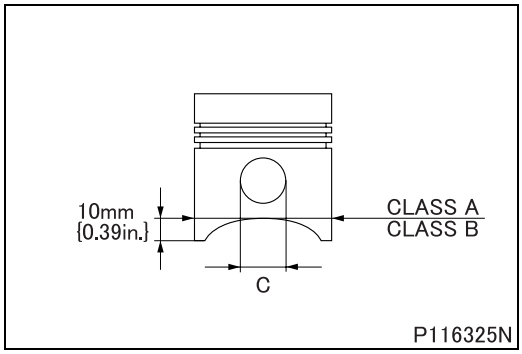


■Inspection: Piston ring groove width

- Remove carbon in the piston ring grooves before taking measurements.
- Take measurements at all around the piston ring groove circumferences.

Standard value	*1st ring	2.200 to 2.230 mm {0.087 to 0.088 in.}
	2nd ring	2.050 to 2.070 mm {0.0807 to 0.0815 in.}
	Oil ring	2.540 to 2.560 mm {0.100 to 0.101 in.}

- * Measure the 1st ring in the position shown in the drawing.
- If the measurement is out of the standard value, replace the piston.

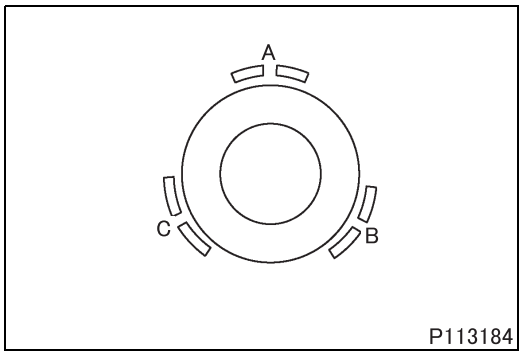


■Inspection: Piston

Standard value	CLASS A	95.705 to 95.715 mm {3.7679 to 3.7683 in.}
	CLASS B	95.715 to 95.725 mm {3.7683 to 3.7687 in.}
	C	36.003 to 36.009 mm {1.4174 to 1.4177 in.}

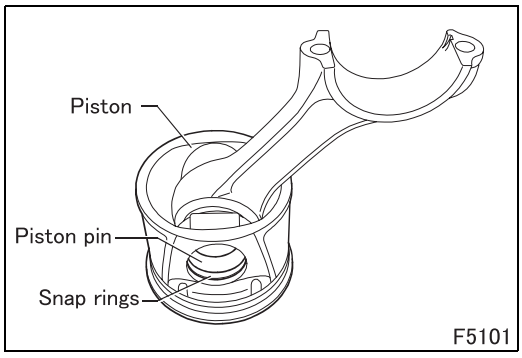
- If the measurement is out of the standard value, replace the piston.

◆Installation procedure◆



■Installation: Piston and connecting rod

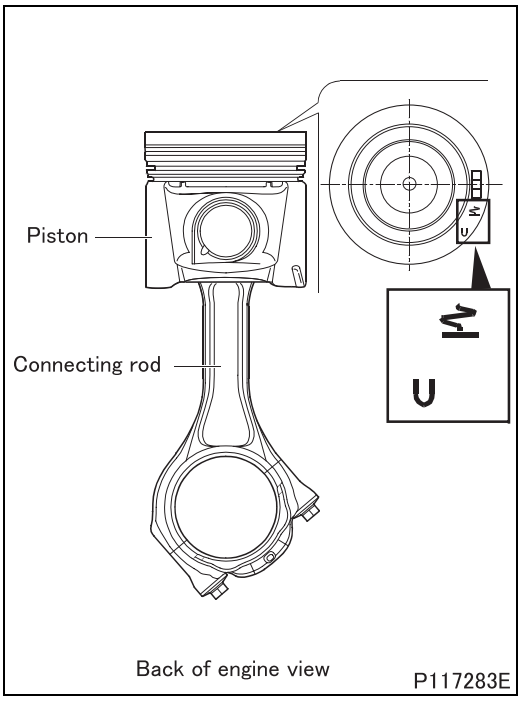
- Apply engine oil to the piston rings and oil ring.
- Install the piston rings and oil ring so that the ring gaps are separated 120 degrees with each other.
- The oil ring gap and expander spring gap should be separated 180 degrees.



- Apply engine oil to the connecting rod and piston pin.
- Position the connecting rod on the piston, insert the piston pin and secure it with the snap rings.

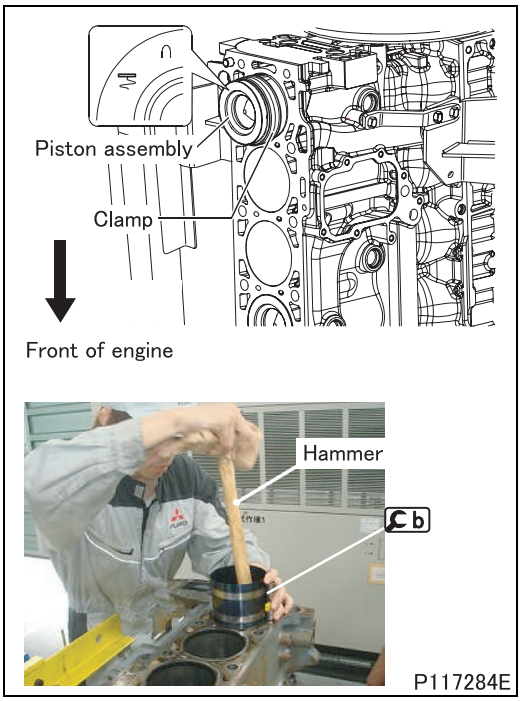
https://truckmanualshub.com/

PISTON AND CONNECTING ROD



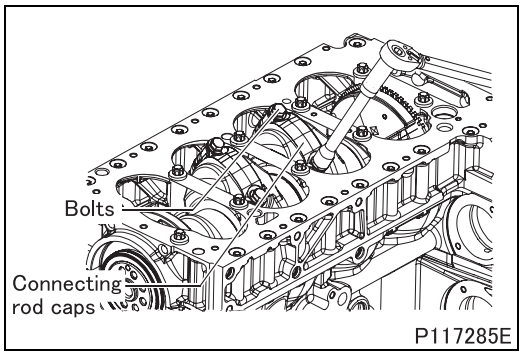
■ **Installation: Piston and connecting rod**

- Connect the piston to the connecting rod together with its cap so that the piston assembly reference, position of the connecting rod and of the cap are observed as shown in the figure.



- Lubricate the pistons well, including the piston rings and the inside of the cylinder block.
  With the aid of b, fit the connecting rod – piston assembly in the cylinder block, checking that:
  - The number of each connecting rod corresponds to the cap mating number.
  - The openings of the piston rings are staggered 120° apart.
  - The pistons are all of the same weight.
  - The symbol punched on the top of the pistons faces the engine flywheel, or the recess in the skirt of the pistons tallies with the oil spray nozzles.
- If connecting rod bearings are reused, you need to fit them back in exactly the same sequence and position found on disassembly.

https://truckmanualshub.com/

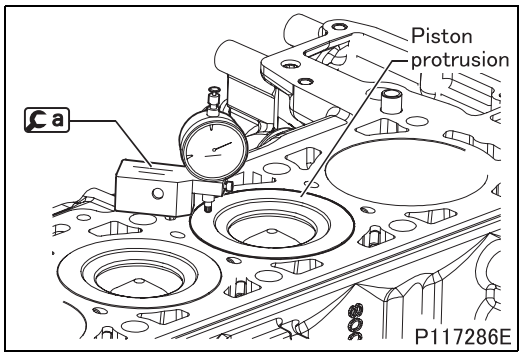


- Install the connecting rod caps with the associated bearing shells.
- The connecting rod cap fixing bolts must always be replaced for permanent assembly.

- Tighten the bolts in two steps.
  Step 1: With a torque wrench, to a torque of 50 N·m {37 ft.lbs, 5.1 kgf·m}.
  Step 2: Closing to an angle of 70°

- Manually check the connecting rod end play to ensure that the connecting rods slide axially on the pins of the crankshaft.

◆Work after installation◆

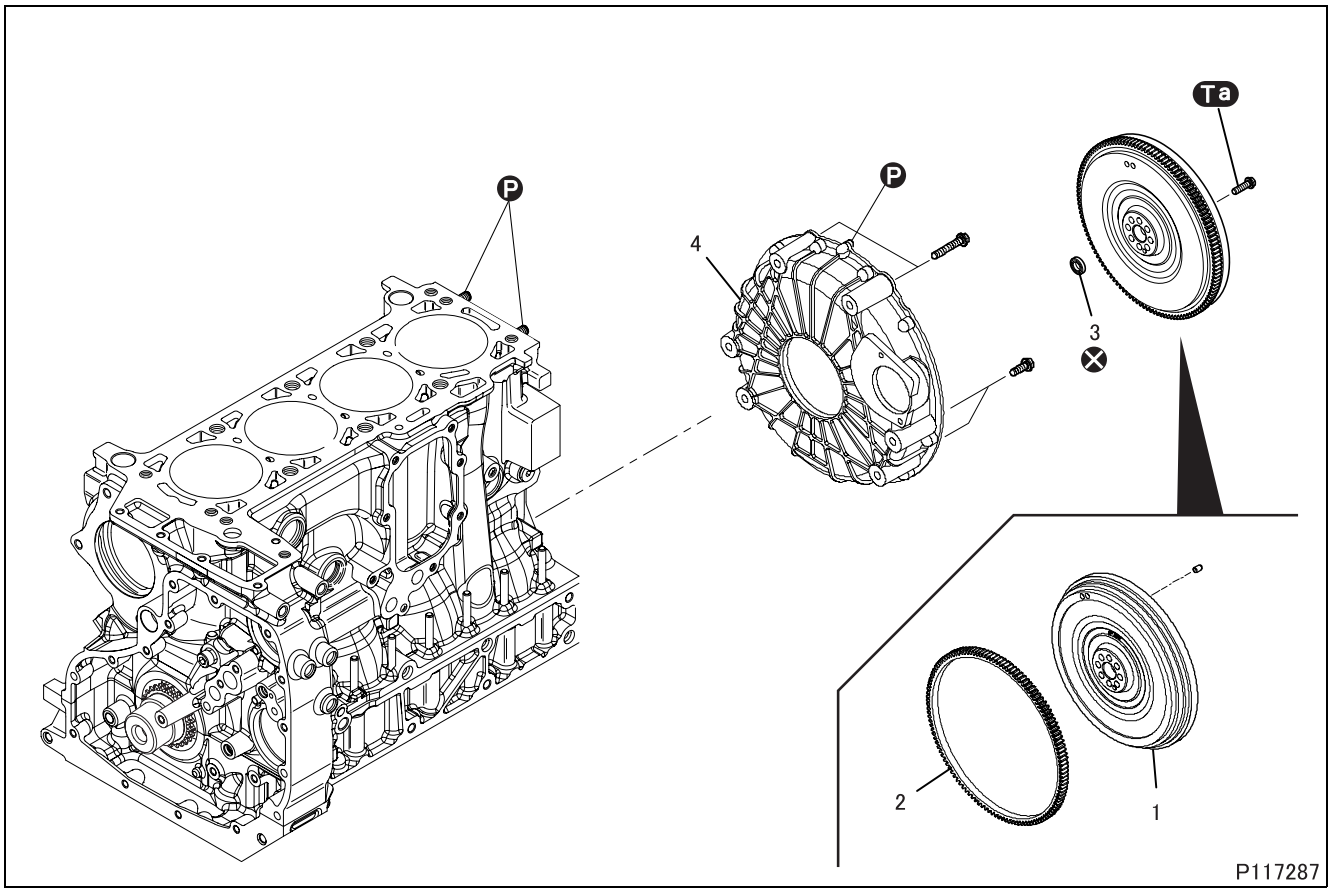


■ Inspection: Piston and connecting rod

- Compare the protrusion of piston at its top dead center with the cylinder block top surface using a.
- Measure the piston protrusion at the top dead center for all pistons.
- The difference between the minimum and maximum protrusions of the four pistons must be ≤ 0.15 mm {0.0059 in.}.

https://truckmanualshub.com/

FLYWHEEL



● **Disassembly sequence**

1 Flywheel
2 Ring gear
3 Bearing
4 Flywheel housing

Ⓟ: Locating pin

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torques (Unit: N·m {ft.lbs, kgf·m})

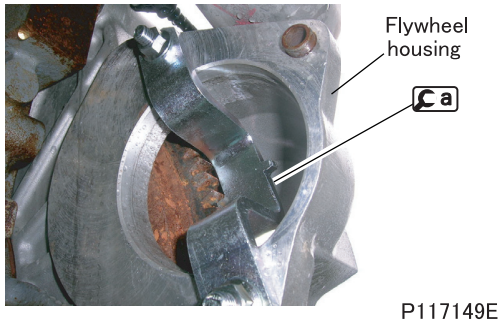
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (flywheel housing mounting)	30 {22, 3.0} + 90°	–

https://truckmanualshub.com/

Special tools

Mark	Tool name and shape	Part No.	Application
ⓐ	Flywheel, retainer  P116334	MH064205	Block rotation of the flywheel

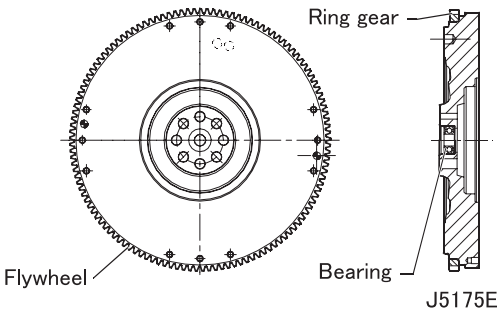
◆Removal procedure◆



■ Removal: Engine flywheel

- Set ⓐ on the starter mount of the flywheel housing to prevent the flywheel from rotating.
- Loosen the bolts to remove the flywheel housing and flywheel.
- After removing the flywheel, check the inside of the flywheel housing for contamination. Clean the inside if it is dirty.

◆Inspection procedure◆



■ Inspection: Engine flywheel

(1) Visual check

- Check the clutch disc mating surface, if there are too many scratches, change the engine flywheel.

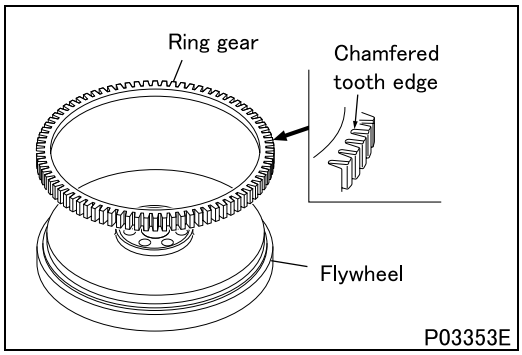
Replacing the ring gear
[Removal]

- Heat the ring gear evenly to a temperature of 200°C {392°F} using a gas burner or the like and remove it from the flywheel.

WARNING ⚠

- **Never touch heated areas to avoid burns.**

https://truckmanualshub.com/



[Installation]

- Heat the ring gear evenly to a temperature of 200°C {392°F} using a gas burner or the like.

WARNING ⚠

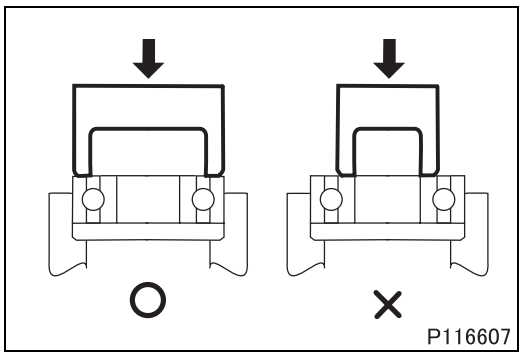
- **Never touch heated areas to avoid burns.**

- Fit the ring gear with the side having non-chamfered teeth edges side facing the flywheel.

(2) Bearing

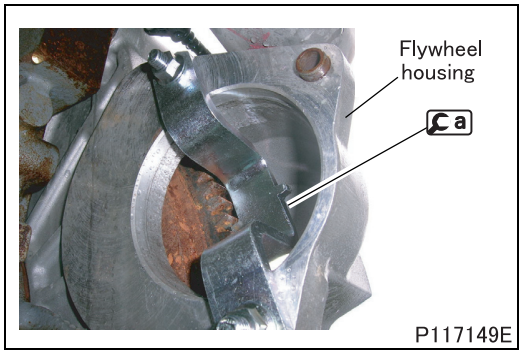
- Replace the bearing if damage, wear or poor rotation is observed.

◆Installation procedure◆



■ Installation: Bearing

- Install the bearing by setting the jig in the position shown in the drawing.



■ Installation: Engine flywheel

- Set cb on the starter mount of the flywheel housing to prevent the flywheel from rotating.
- Install the flywheel housing.

- Tighten the bolts fixing the flywheel in two steps.
  Step 1: With a torque wrench, to a torque of 30 N·m {22 ft.lbs, 3.1 kgf·m}.
  Step 2: Closing to an angle of 90°.

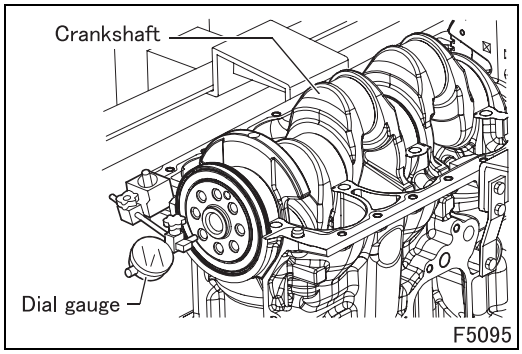
Bearing shells to main journals clearance is 0.032 to 0.102 mm {0.0013 to 0.0040 in.}.

◆Work before disassembly◆



■ Crankshaft end play

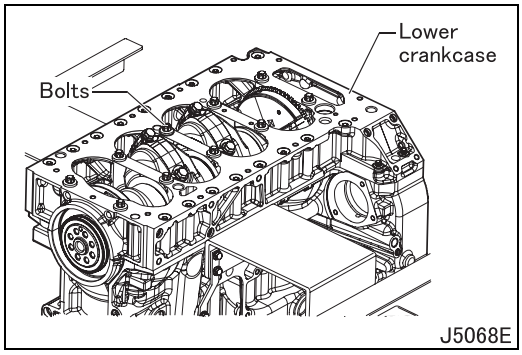
- With the crankshaft installed, check the following item.
- The end play is checked by setting a dial gauge with a magnetic base on the crankshaft as shown in the figure. The normal assembly clearance is 0.010 to 0.210 mm {0.00039 to 0.0083 in.}.
- If you find the clearance to be greater than as required, replace the central half-bearing shells carrying the thrust bearings and repeat the clearance check between the crankshaft pins and the main bearing shells. Bearing shells to main journals clearance is 0.032 to 0.102 mm {0.0013 to 0.0040 in.}.
- If the end play of the crankshaft does not come within the prescribed values, it is necessary to grind the crankshaft and accordingly change the main bearing shells.

NOTE

- **The central half-bearing has half thrust washers integrated in it, so it performs the function of a thrust bearing. It is supplied as a spare part only with the normal shoulder thickness.**

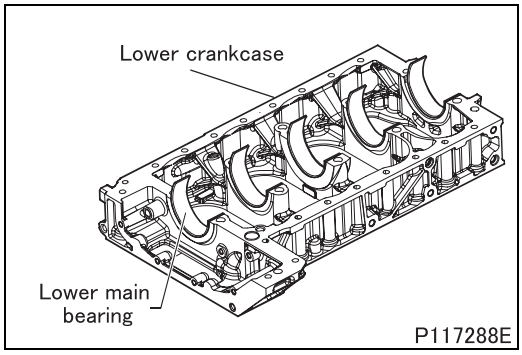
https://truckmanualshub.com/

◆Removal procedure◆



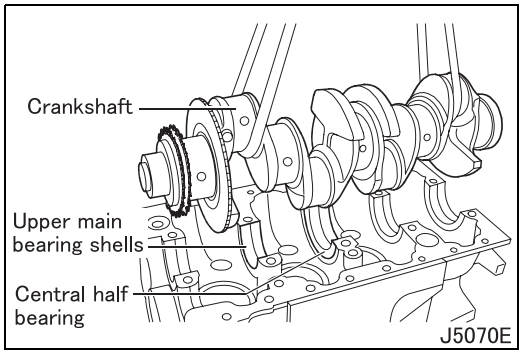
■ **Removal: Lower crankcase**

- Remove the bolts and take off the crankcase.



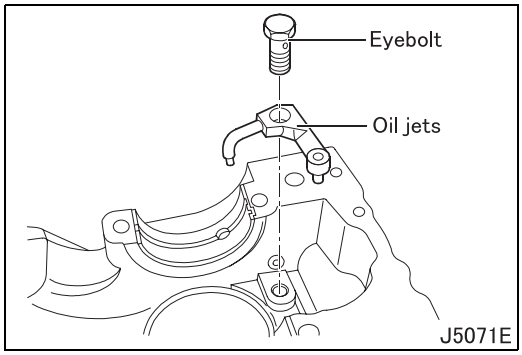
■ **Removal: Lower main bearing**

- If the lower main bearing is reused, make a note of its assembly position since it needs to be installed in the original position before removal.



■ **Removal: Crankshaft, upper main bearing, central half-bearing**

- With the aid of a hoist and a rope, remove the crankshaft.
- Note the assembly position of the top main bearing shells since, if they are reused, they will need to be fitted in the position found during removal.
- The central half-bearing is fitted with shoulder half-rings.

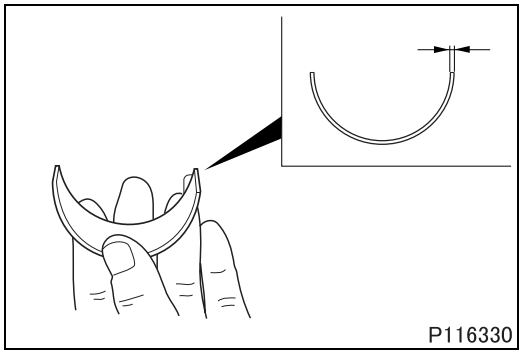


■ **Removal: Oil jet**

- Take out the eyebolts and remove the oil jets.

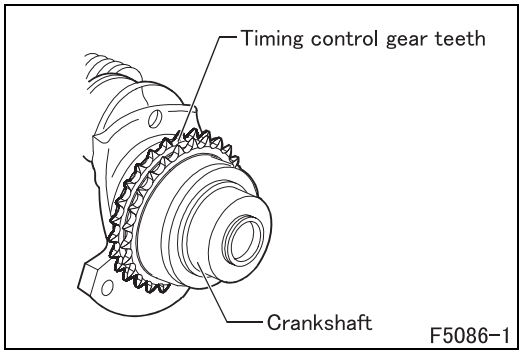
https://truckmanualshub.com/

◆Inspection procedure◆



■Main bearing thickness

- If the measurement is out of the standard value, replace the main bearing.
  Standard value: 2.165 to 2.174 mm {0.0852 to 0.0855 in.}



■ Inspection: Timing control gear

- On finding the timing control gear teeth damaged or worn, remove them from the crankshaft using a suitable extractor.

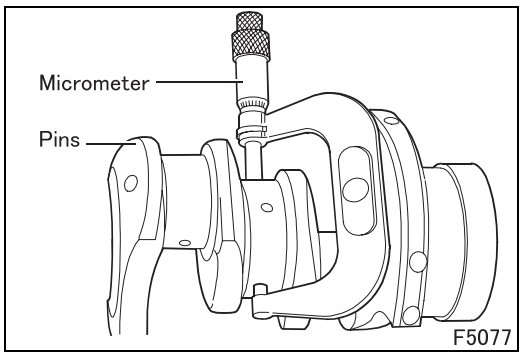
Replacement of timing control gear
[Installation]

- The new gear is fitted onto the crankshaft by heating it to a temperature of 180°C {356°F}.

WARNING ⚠

- **Never touch heated areas to avoid burns.**

- On completing assembly and after the gear has cooled, it must withstand a torque of 150 N·m {110 ft.lbs, 15 kgf·m} without slipping.



■ Inspection: Crankshaft

- When inspecting the main journals and crankpins, if any signs of seizure or scoring are found, or if they are found to be excessively out of round, it is necessary to regrind the pins. Before grinding the pins, measure the shaft pins with a micrometer to establish to what diameter it is necessary to decrease the pins.

NOTE

- **It is advisable to enter the measurements in a table.**

https://truckmanualshub.com/

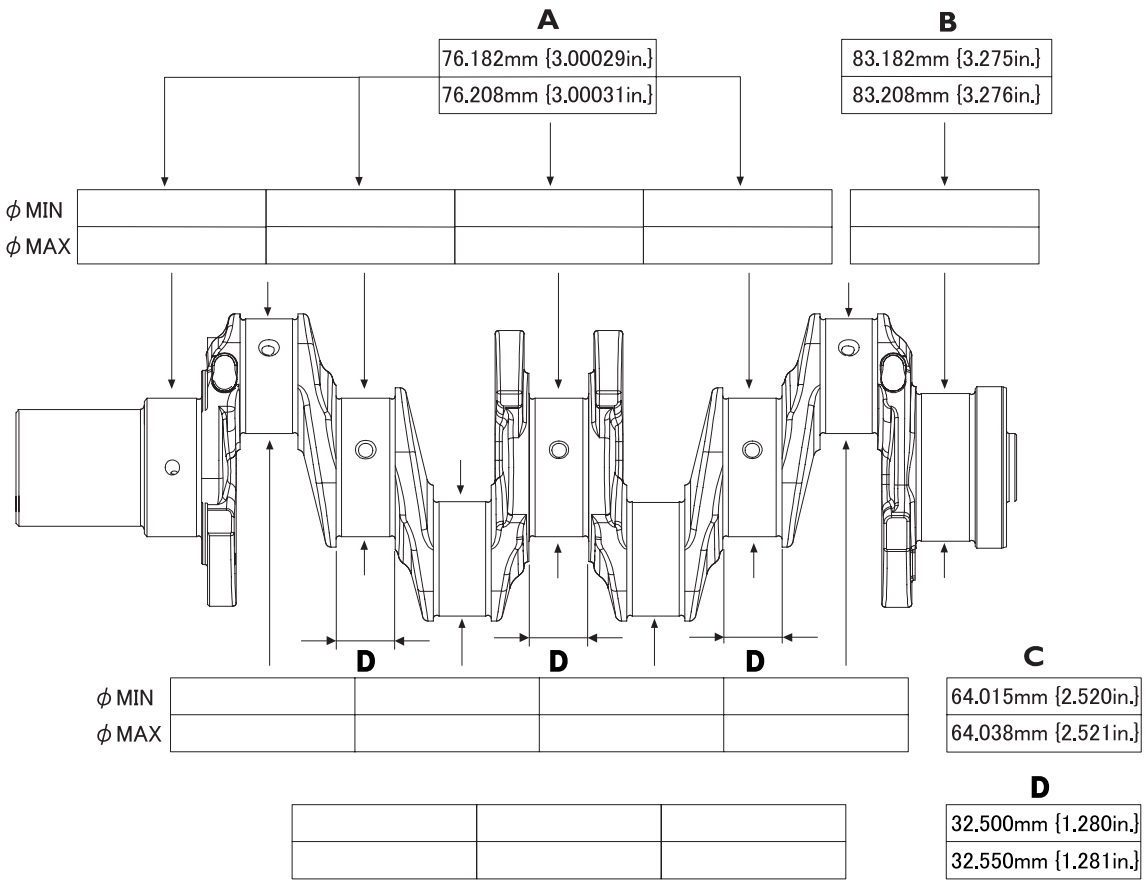


TABLE IN WHICH TO ENTER THE MEASUREMENTS OF THE CRANKSHAFT MAIN JORNALS AND CRANKPINS
A, B, C=NOMINAL VALUE

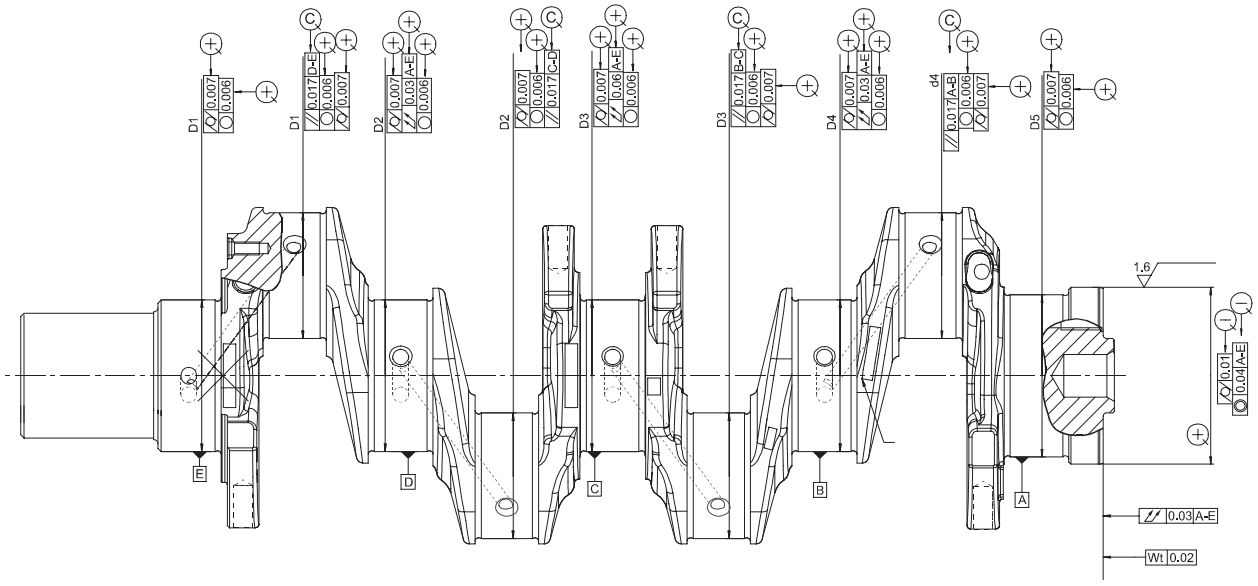
N5078

- The main journals and crankpins must always be ground to the same undersize class.
- The undersizing performed, on the main journals or crankpins, must be marked by punching on the side of crank arm number. 1.
  - For undersized crankpins, letter M.
  - For undersized main journals, letter B.
  - For undersized crankpins and main journals, letter MB.
- The undersize classes are: 0.254 to 0.508 mm {0.0100 to 0.020 in.}.

https://truckmanualshub.com/

[Correction]

- When correcting, keep the following dimension.

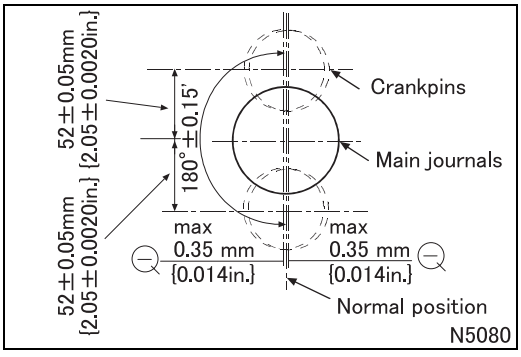


MAIN CRANKSHAFT TOLERANCES

TOLERANCES	TOLERANCE CHARACTERISTIC	GRAPHIC SYMBOL
SHAPE	Circularity	○
	Cylindricality	⌭
ORIENTATION	Parallelism	//
	Perpendicularity	⊥
POSITION	Concentricity or coaxiality	◎
OSCILLATION	Circular oscillation	↗
	Total oscillation	⌰

CLASS OF IMPORTANCE ATTRIBUTED TO PRODUCT CHARACTERISTICS	GRAPHIC SYMBOL
CRITICAL	Ⓒ
IMPORTANT	⊕
SECONDARY	⊖

F5079



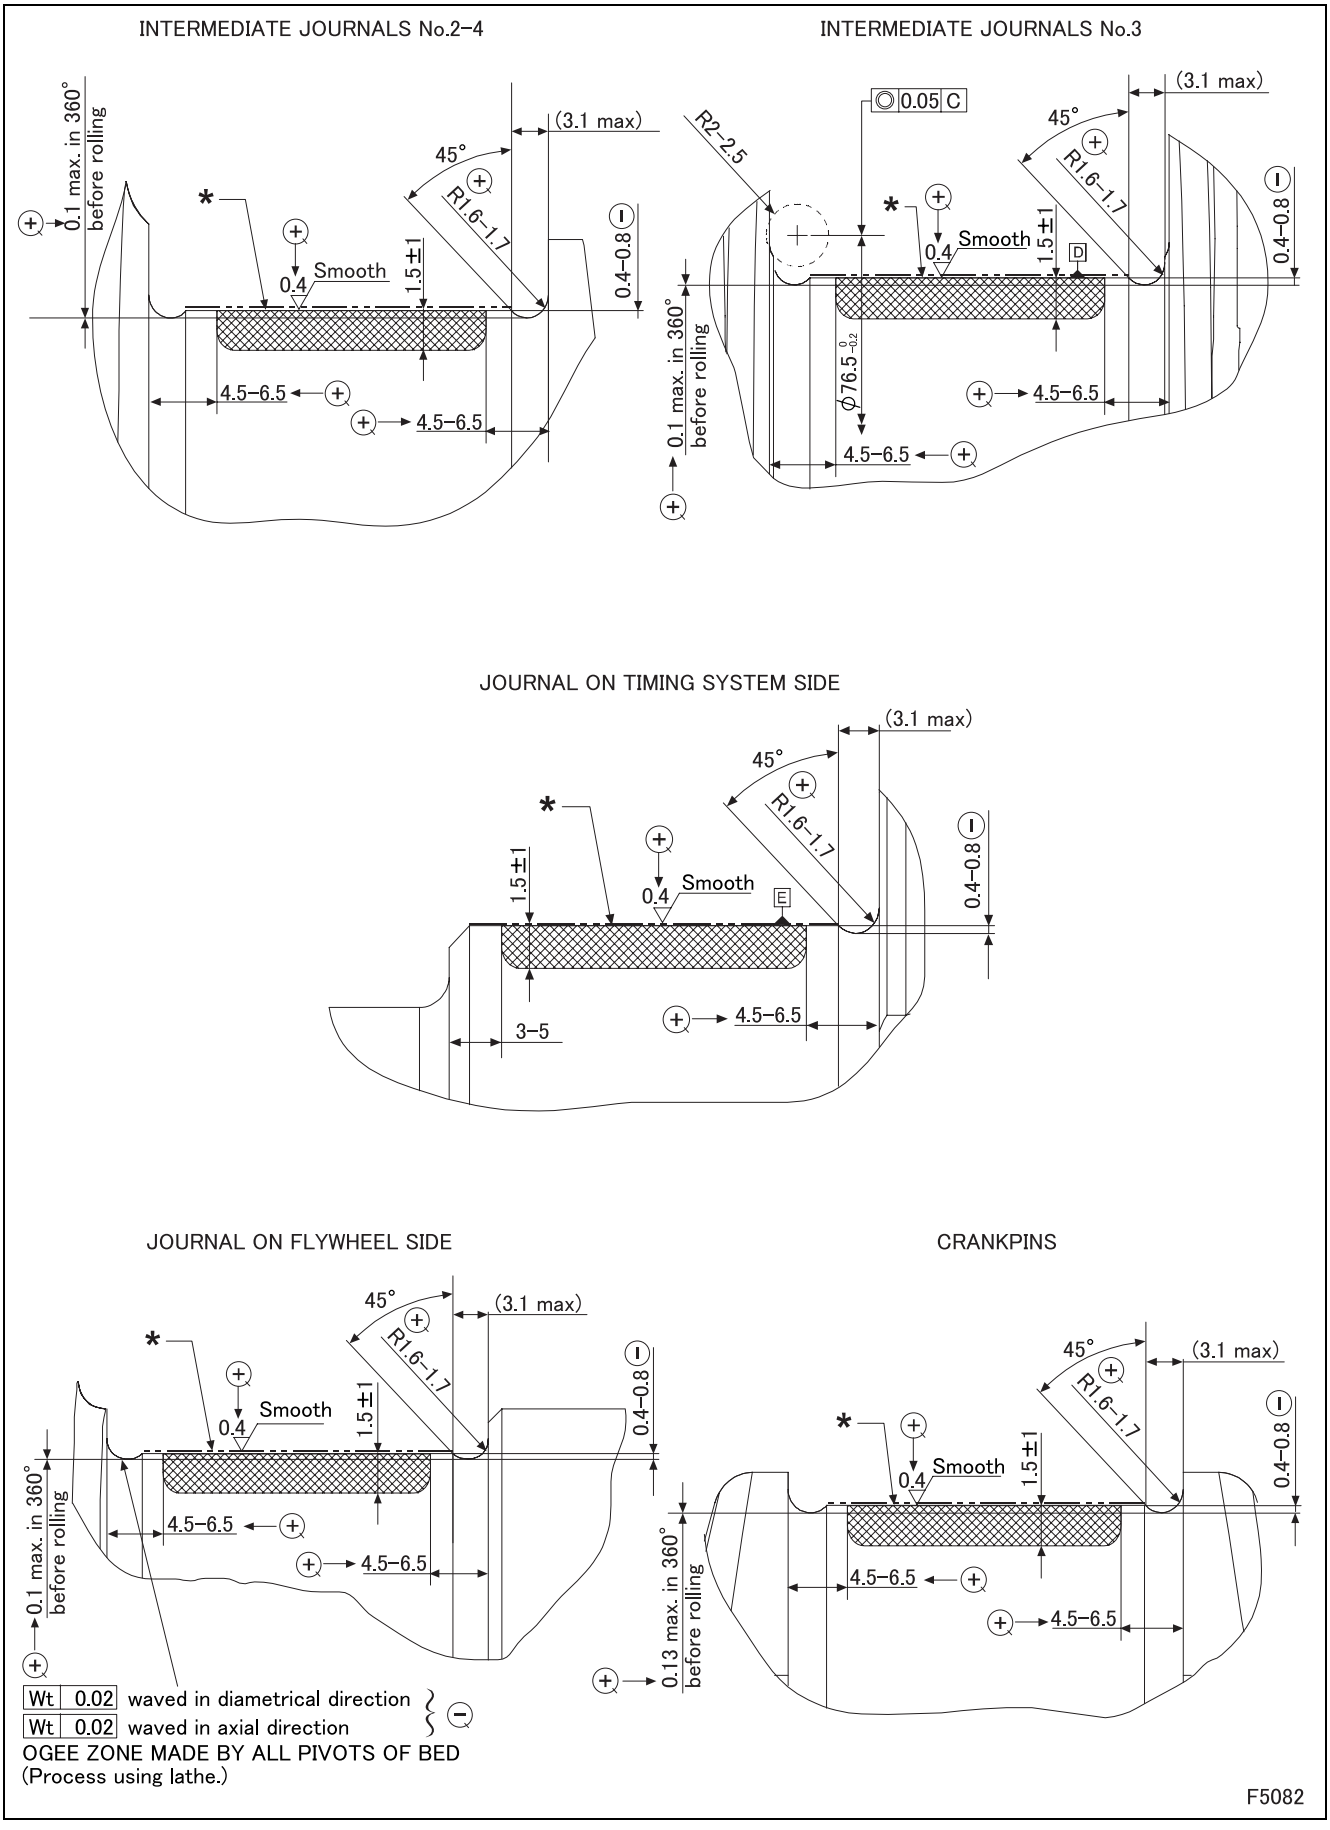
N5080

NOTE

- **The checks on the tolerances indicated in the figures must be made after grinding the crankshaft pins.**

- Symmetry between main journals and crankpins
- After grinding, keep to the following.
  - Round off the edges of deburring the holes for lubrication of the main journals and crankpins.

https://truckmanualshub.com/



https://truckmanualshub.com/

NOTE

- **Since, during the 0.254 and 0.508 mm {0.0100 to 0.020 in.} under sizing on the diameter of the crankpins and main journals, the rolled portion of the side races of the pins may get involved, it is necessary to turn the races keeping to the data given in the figure and to do the rolling keeping to the following instructions.**

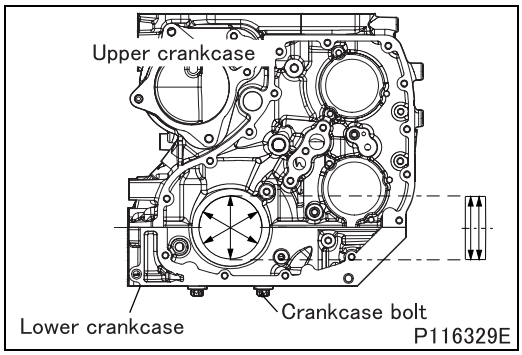
- Rolling force:
  - 1st main journal: 925 ± 25 daN.
  - 2nd - 3rd - 4th - 5th main journal: 1850 ± 50 daN.
  - Crankpin: 1850 ± 50 daN.
- Rolling turns: 3 approach, 12 effective, 3 out.
- Rolling speed: 56 rpm.
- Reduction of the connecting rod pin slot diameter after rolling: 0.15 to 0.30 mm {0.0059 to 0.012 in.}*.
- Reduction of the journal slots after rolling: 0.15 to 0.30 mm {0.0059 to 0.012 in.}*.

* Measured with calibrated rollers ϕ2.5 mm {0.098 in.}.

■ Inspection: Crankcase

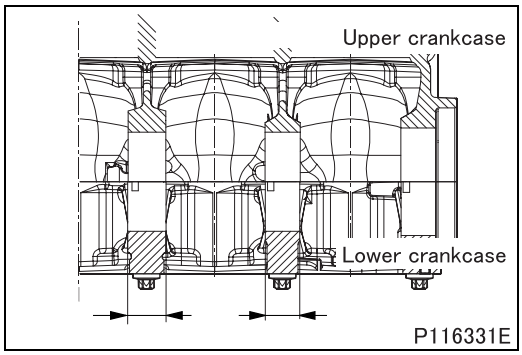
(1) Visual inspection of crankcase

- Once the engine removal is complete, carefully clean the crankcase.
- For the crankcase transportation use the suitable rings.
- Carefully check that the crankcase has no cracks in it.
- Check the state of the plugs. If they are rusty or there is any doubt about their seal, replace them. When fitting the caps into place, apply Loctite 270 sealant to the same.



(2) Inner diameter of crankcase

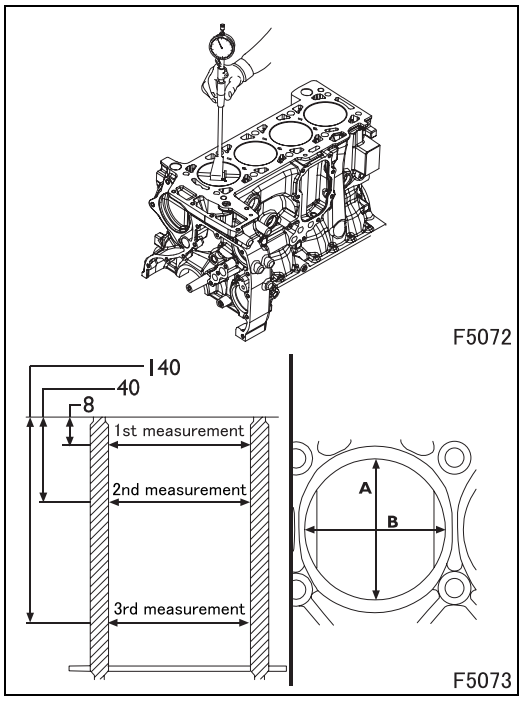
- Install the lower crankcase on the upper crankcase, and then tighten the crankcase bolts to a torque of 50 N·m {37 ft.lbs, 5.1 kgf·m}.
- Measure the inner diameter of the crankcase.
  Standard value
  No.1, 2, 3, 4: 80.588 to 80.614 mm {3.1727 to 3.1738 in.}
  No.5: 87.588 to 87.614 mm {3.4483 to 3.4494 in.}
- If the measurement is out of the standard value, replace defective parts.



(3) Main bearing width of crankcase

- If the measurement out of the standard value, replace the crankcase.
  Standard value: 27.290 to 27.340 mm {1.074 to 1.076 in.}

https://truckmanualshub.com/

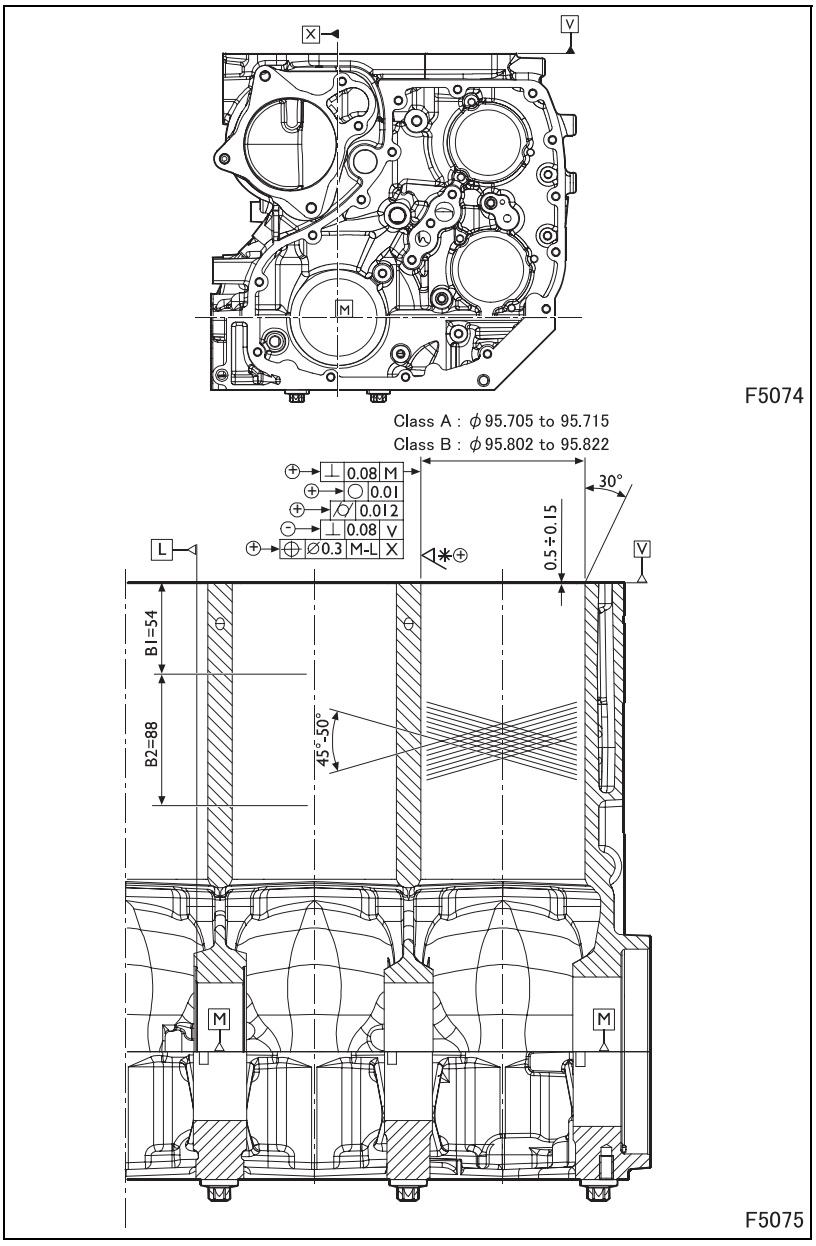


(4) Cylinder bore

[Inspection]

- Examine the surfaces of the cylinder bores; they must show no sign of meshing, scoring, out of roundness of the bores, taper or excessive wear.
- The inside diameter of the cylinder bores is checked, to ascertain the extent of out of roundness of the bores, taper and wear, using the bore meter fitted with a dial gauge previously reset on the ring gauge of the diameter of the cylinder bore or on a micrometer.
- The measurements must be made for each single cylinder at three different heights up the liner and on two planes at right angles to each other: one parallel to the longitudinal axis of the engine (B) and the perpendicular (A); the greatest wear is generally found on this last plane with the first measurement.
- On finding out of roundness of the bores, taper or wear, go ahead and bore/grind and finish the face of the cylinder bores. The refacing of the cylinder liners should be done in relation to the diameter of the pistons supplied as spare parts oversized by 0.4 mm {0.016 in.} of the nominal value and to the prescribed assembly clearance.

https://truckmanualshub.com/



[Correction]

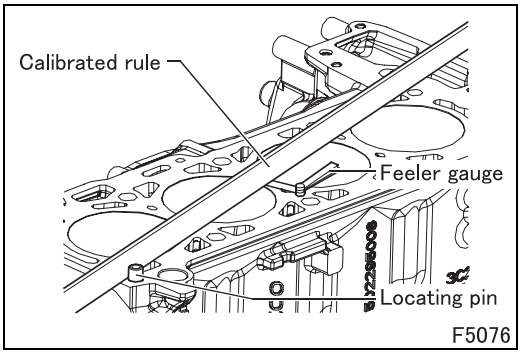
- When correcting, keep the following dimension.
  * Surface roughness parameters:
- Permissible surface porosity for machined cylinder
  - R1 = 4 to 10 µm
  - Rz = 3 to 8 µm
  - Ra = 0.25 to 0.6 µm
  - W1 ≤ 1.5 µm

ZONE B1

- Area of greatest mechanical stress, segment/liner contact: No.2 non-continuous porosities are permissible max. 0.5 × 0.5.

ZONE B2

- Surface involved in segment rubbing: No.2 non-continuous porosities are permissible max. 1 × 0.8.



(5) Cylinder head mating surface

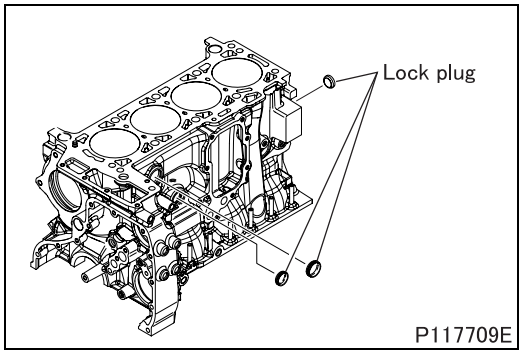
- See that the head mating surface, on the crankcase, has no deformation.
- This check can be made, after taking out the locating pin, with a surface plate spread with carbon black or with a calibrated rule and a feeler gauge. After ascertaining the areas of deformation, level the bearing surface with a grinding machine.

NOTE

- **The crankcase can only be surfaced after making sure that, on completing the work, the piston protrudes from the cylinder liner by no more than the prescribed value.**

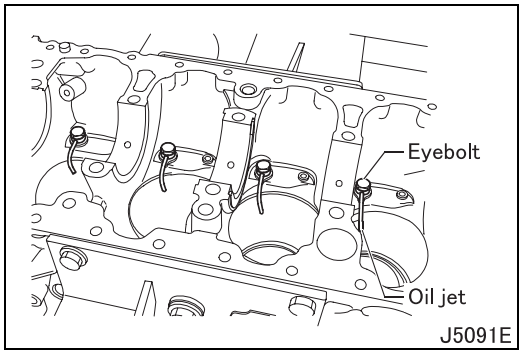
https://truckmanualshub.com/

◆Installation procedure◆



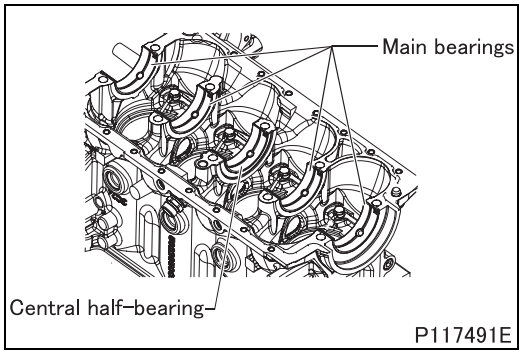
■ **Installation: Lock plug**

- Clean the lock plug mounting surface on the upper crankcase.
- Apply sealant to the lock plug. (Loctite 263)
- Install the lock plug on the upper crankcase.



■ **Installation: Oil jet**

- Replace the eyebolt with a new one.
- Fit on the oil jet and tighten the eyebolt to the prescribed torque 25 N·m {18 ft.lbs, 2.5 kgf·m}.



■ **Installation: Main bearing, central half-bearing**

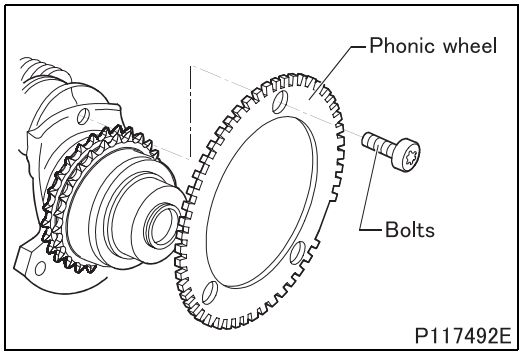
- The main bearings are supplied as spare parts undersized on the inside diameter by 0.254 to 0.508 mm {0.0100 to 0.020 in.}.
- If the main bearings are reused, they need to be fitted back on in the same sequence and position found upon disassembly.
- Thoroughly clean the top main bearing shells and position them in the crankcase.

NOTE

- **The central half-bearing is fitted with thrust washers.**

NOTE

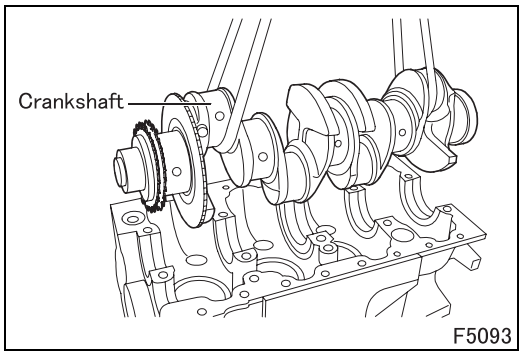
- **Do not do any altering of the bearings.**



■ **Installation: Phonic wheel**

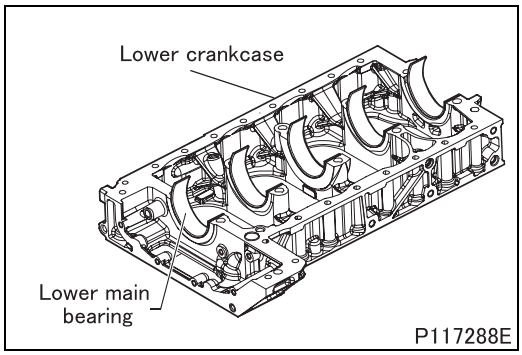
- Install the phonic wheel.
- Install the bolts and tighten them to the prescribed torque: 10 ± 1 N·m {7.4 ± 0.1 ft.lbs, 1.0 ± 0.1 kgf·m}.

https://truckmanualshub.com/



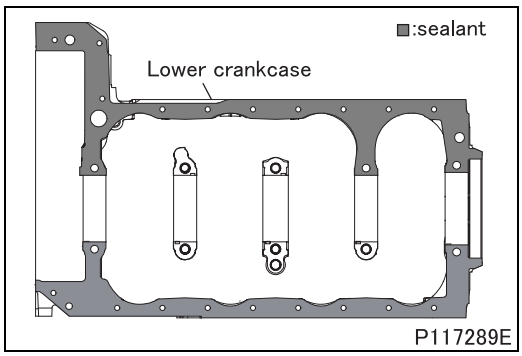
■ **Installation: Crankshaft**

- Install the crankshaft.



■ **Installation: Main bearing shell**

- Thoroughly clean the bottom main bearing shells and mount them in the lower crankcase.



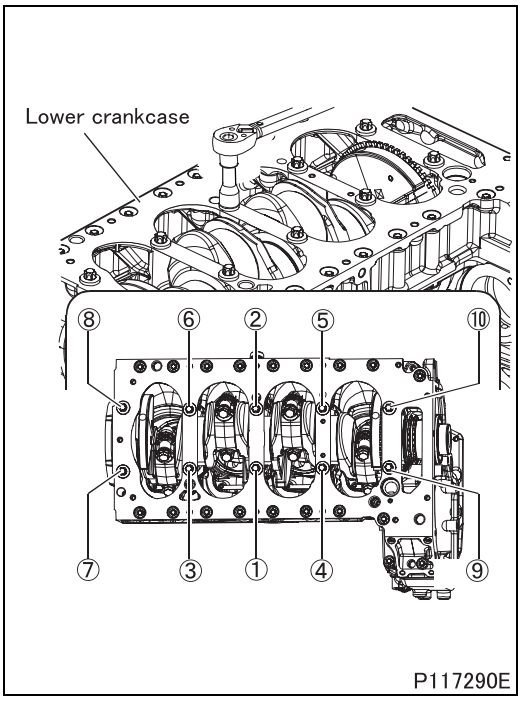
■ **Installation: Crankcase base**

- Thoroughly clean the crankcase/crankcase base mating surface.
- Apply, on base, sealant Loctite 510 as indicated in the scheme. The sealant must be applied evenly.

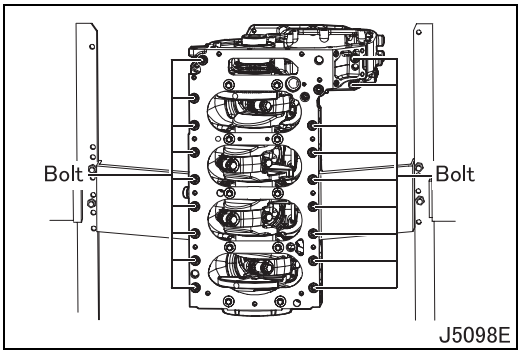
NOTE

- **Mount the crankcase base within 10 minutes of applying the sealant.**

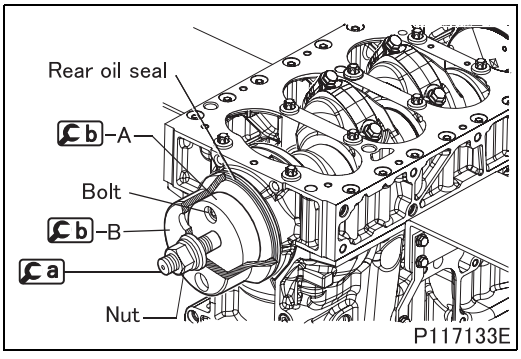
https://truckmanualshub.com/



- Mount the lower crankcase and tighten the fixing screws in three stages, following the sequence shown in the figure.
  Step 1: With a torque wrench, to a torque of 50 N·m {37 ft.lbs, 5.1 kgf·m}.
  Step 2: Tighten to an angle of 60°.
  Step 3: Tighten to an angle of 60°.



- Then tighten the outer bolts to a torque of 26 N·m {19 ft.lbs, 2.7 kgf·m}.



■ **Installation: Rear oil seal**

- Clean the mating surface of the rear oil seal.
- Apply engine oil to the rear of the crankshaft.
- Install part of b-A on the rear of the crankshaft, secure it with the bolt and install a new rear oil seal over it.
  Place b-A over b-B, screw in the nut and install the rear oil seal on the seat of the upper crankcase.

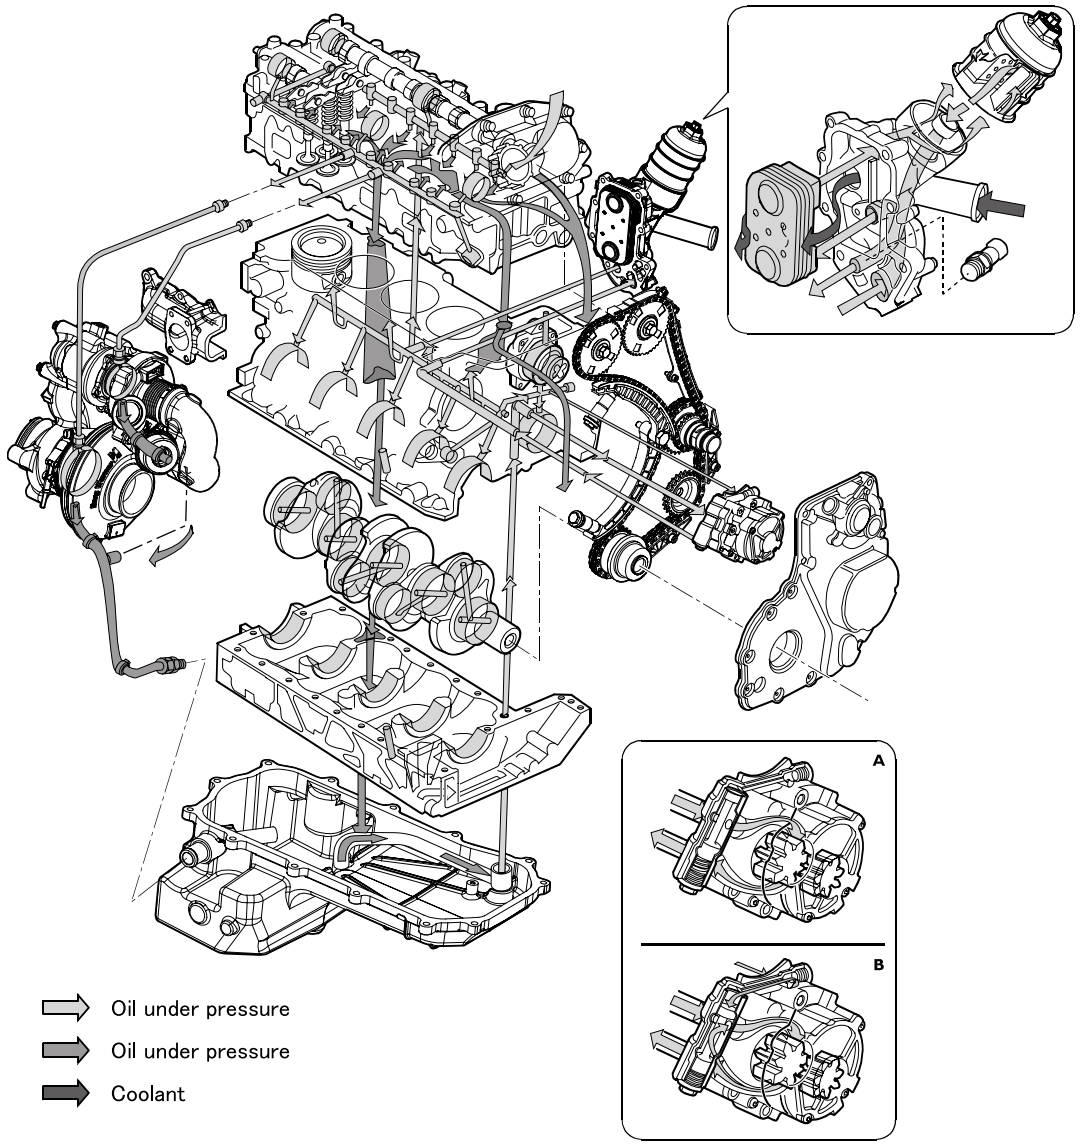
SPECIFICATIONS

Item			Specifications
Method of lubrication			Forced lubrication by oil pump
Oil filter			Element filter paper type
Oil cooler			Shell and plate type (multiple-plate type)
Engine oil	Classification	Viscosity	API classification CJ-4 or ACEA C2
	API CJ-4	Below 0°C (32°F)	10W-30
		Above –15°C (5°F)	15W-40
		Above 30°C (86°F)	40
	ACEA C2	Below 0°C (32°F)	SW-30
	Quantity	L {qts}	6.2 {6.5}
Regulator valve opening pressure		kPa {psi, kgf/cm^2}	440 {64, 4.5}

https://truckmanualshub.com/

1. Lubrication System



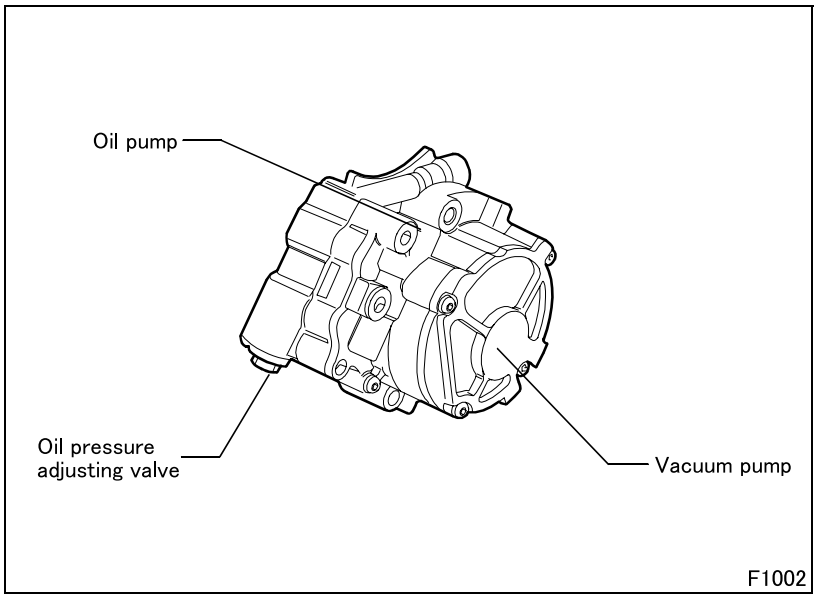
A. Pressure regulating valve closed – B. Pressure regulating valve open

P116571-1E

- The engine is lubricated by forced circulation performed by the following parts.
  - A gear oil pump with built-in vacuum pump.
  - A pressure relief valve integrated in the oil pump.
  - An oil cooler made up of five elements.
  - A double filtration oil filter with built-in safety valve.
- Engine oil is drawn up from the sump by the oil pump via the oil strainer and delivered under pressure to the oil cooler where it is cooled.
- The oil continues through the oil filter and goes to lubricate the relevant parts through ducts or pipes.
- At the end of the lubrication cycle, the oil returns to the oil pan by gravity. The oil filter can be bypassed by the safety valve built into it if it gets clogged.
  In addition, the lubricating oil feeds the chain hydraulic tightening devices for the control of the auxiliary elements and the timing system and the hydraulic tappet.

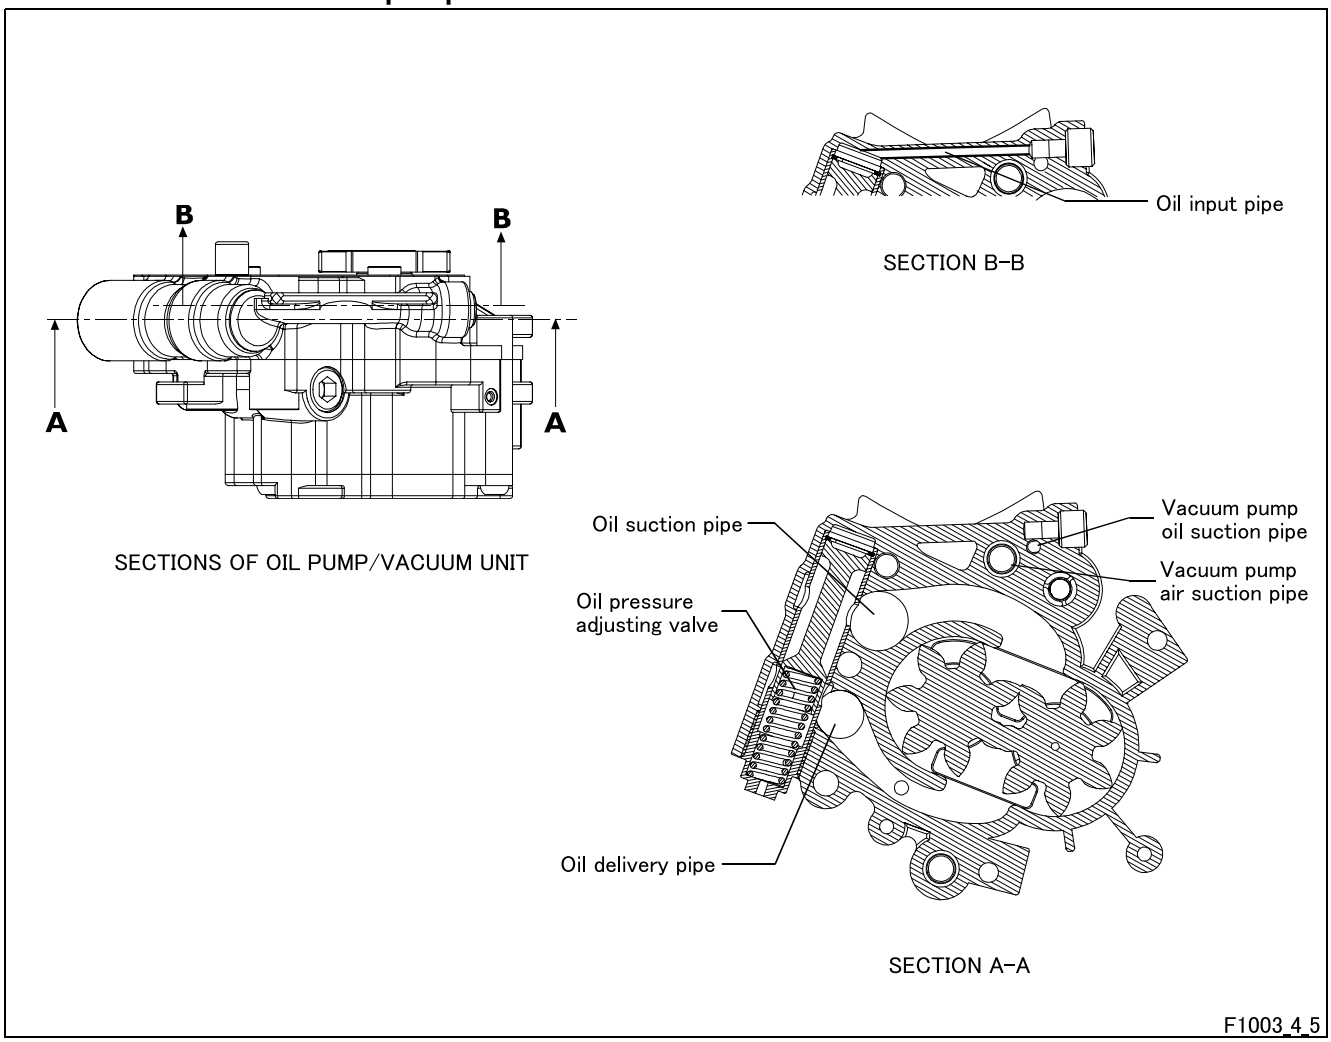
https://truckmanualshub.com/

2. Oil Pump/Vacuum Unit



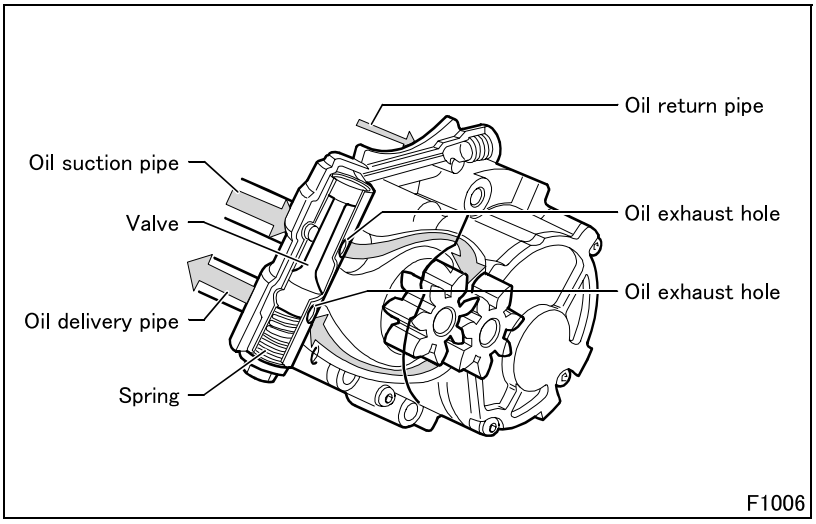
- The vacuum pump, with radial blades, is also incorporated in the oil pump. It is driven directly by the oil pump.

2.1 Cross section of the oil pump/vacuum unit



https://truckmanualshub.com/

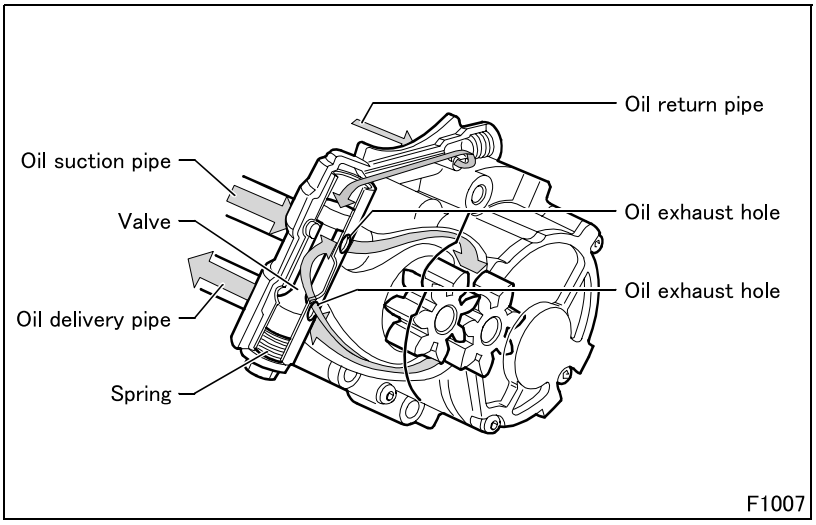
2.2 Oil pressure adjusting valve



Pressure at opening start: 440 kPa {64 psi, 4.5 kgf/cm^2}

(1) Oil pressure adjusting valve closed

- If in pipe the oil pressure is below 440 kPa {64 psi, 4.5 kgf/cm^2}, the valve closes the holes.

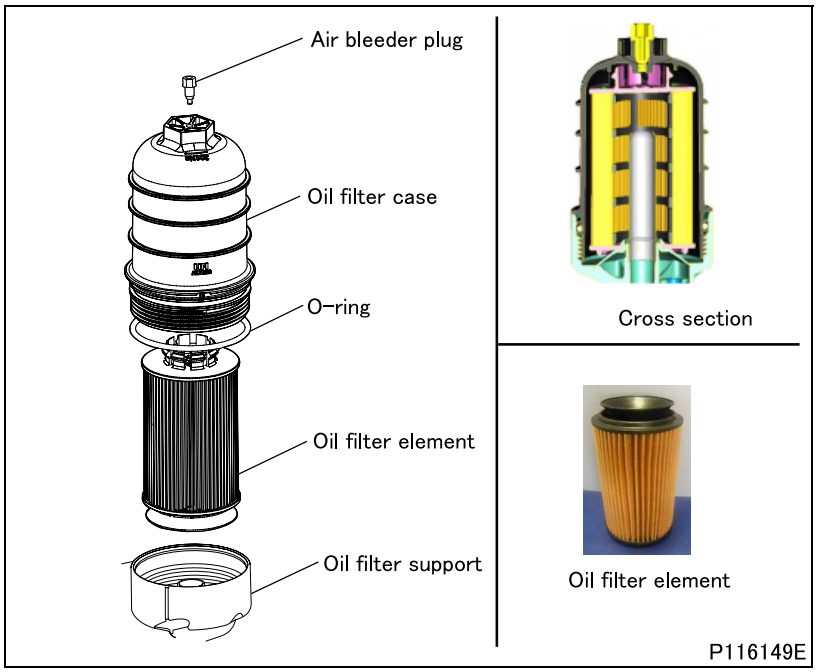


(2) Oil pressure adjusting valve open

- If in oil return pipe the oil pressure is equal or above 440 kPa {64 psi, 4.5 kgf/cm^2}, the valve, as a result of the pressure itself, wins through the spring reaction and goes down, thus opening communication between the delivery pipe and the suction pipe, through draining holes, and therefore the pressure drops.
  When the pressure falls below 440 kPa {64 psi, 4.5 kgf/cm^2}, the spring takes the valve to the initial position of closed valve.

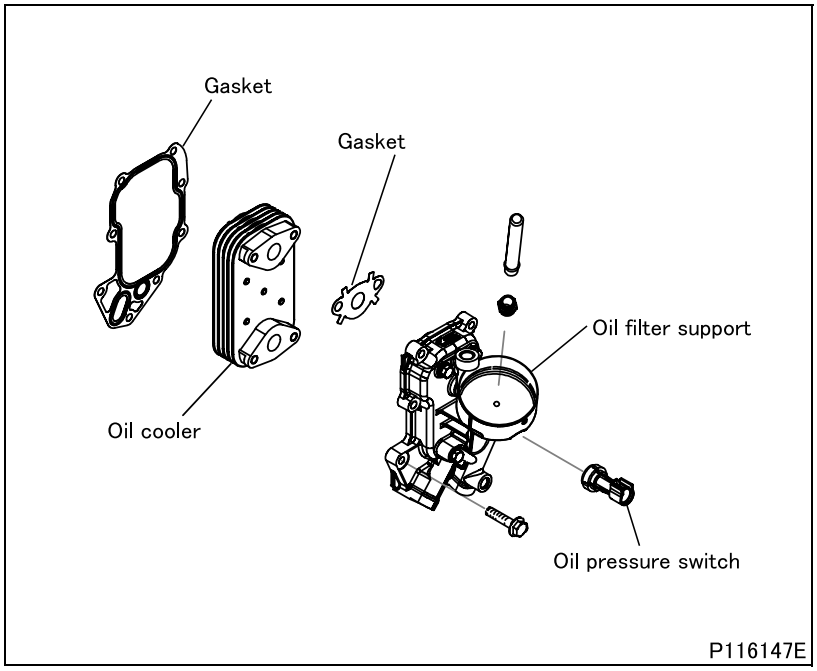
https://truckmanualshub.com/

3. Oil Filter



- Oil filter with built in by-pass valve – differential opening pressure 250 ± 20 kPa {36 ± 2.9 psi, 2.5 ± 0.2 kgf/cm^2}.

4. Oil Cooler



https://truckmanualshub.com/

Possible causes \ Symptoms		Engine is difficult to start	Overheating	Low oil pressure	Excessive oil consumption (oil leakage)	Reference Gr
Oil cooler	Incorrectly mounted element		O	O	O

Poor oil quality			O			
Deterioration of oil			O			
Fuel mixed with oil				O		

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Oil Filter Replacement

WARNING ⚠

- **If engine oil is spilled, wipe it off carefully. Spilled oil may cause a fire.**
- **Be careful when handling hot engine oil, which may cause a burn.**

CAUTION ⚠

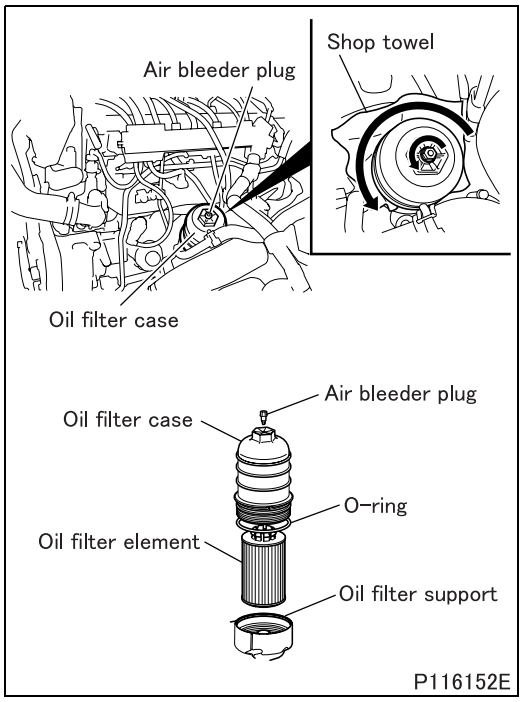
- **Use the specified type of engine oil. Otherwise, the diesel particulate filter may be prematurely clogged.**
- **Do not allow engine oil to adhere to the belt. Otherwise, the belt may become slippery, resulting in degraded cooling performance.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Oil filter support	25 to 30 {18 to 22, 2.5 to 3.0}	–
–	Air bleeder plug	1.5 ± 0.6 {1.1 ± 0.4, 0.2 ± 0.1}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	O-ring	Engine oil	As required



■ Removal: Oil filter element

- Warm up the engine if it is cold.
  Let the engine oil temperature rise to about 40°C {104°F}. (Run the engine at idle for about 20 min. to increase the engine oil temperature from about 0°C to 40°C {0°F to 104°F}.) Without warming up the engine, the engine oil will come out when the oil filter case is removed.
- Loosen the oil filter case. (Approx. 2.5 rotations.)
- Remove the air bleeder plug from the oil filter case. Wait for at least 5 minutes to drain the engine oil in the oil filter case.
- Remove the oil filter case.
  Wrap up the oil filter case with a shop towel when removing it so that oil will not spill out.

CAUTION ⚠

- **After removing the oil filter case, be careful not to allow foreign objects to enter the oil filter case or oil filter support.**

- Remove the O-ring from the oil filter case.
- Remove the oil filter element from the oil filter support.
- Clean the oil filter case, oil filter support surface that contacts the O-ring, and the O-ring groove on the filter case with a shop towel.

https://truckmanualshub.com/

■ **Installation: Oil filter element**

- Apply a thin coat of engine oil to a new O-ring and install the O-ring on the oil filter case.

CAUTION ⚠

- **Use the O-ring and air bleeder plug that came with a new oil filter element.**

- Install an oil filter element with its hole located on the bottom side.
- Install a new air bleeder plug on the oil filter case, then install the oil filter case on the oil filter support.
- After installing the oil filter case, check that there is no gap between the contact surfaces of the oil filter case and oil filter support.

- Following the procedure given in the section “Starting the engine after parking for a long period” (See later section.), start the engine and warm it up until the needle of the water temperature gauge begins to move.

- Stop the engine. After at least 10 minutes, check the engine oil level. (See later section.)
- Start the engine and check that oil is not leaking. (See later section.)
- If any abnormality is found, reinstall the oil filter.
- Stop the engine and check the engine oil level. (See later section.)
- Add engine oil if the oil level is too low.

- When the engine oil has been replaced, reset the inspection/service memory of the multi-information system. (See Chapter 6 “Multi-information system” in the Owner’s Manual.)

https://truckmanualshub.com/

2. Engine Oil Replacement

WARNING ⚠

- **If engine oil is spilled, wipe it off carefully. Spilled oil may cause a fire.**
- **Be careful when handling hot engine oil, which may cause a burn.**

CAUTION ⚠

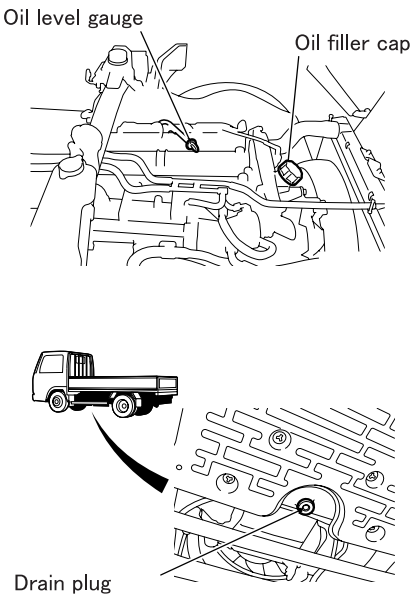
- **Use the specified type of engine oil. Otherwise, the diesel particulate filter may be prematurely clogged.**
- **Do not allow engine oil to adhere to the belt. Otherwise, the belt may become slippery, resulting in degraded cooling performance.**
- **Make sure to reset the engine electronic control unit every time after refilling. Because the engine control unit calculates the engine oil life.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Drain plug (oil pan)	20 {15, 2.0}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Oil pan	Engine oil	Approx. 6.2 L {6.5 qts}



■ Draining: Engine oil

- Warm up the engine if it is cold.
  Let the engine oil temperature rise to about 40°C {104°F}. (Run the engine at idle for about 20 min. to increase the engine oil temperature from about 0°C to 40°C {0°F to 104°F}.) Without warming up the engine, you may not drain the engine oil from the oil filter.
- Remove the filler cap.

CAUTION ⚠

- **After removing the filler cap, be careful not to allow foreign objects to enter the engine case.**

- Remove the drain plug to drain the engine oil.

■ Refilling: Engine oil

- Install a new gasket on the drain plug, and then install the drain plug.
- Add new oil through the oil filler.

CAUTION ⚠

- **Use a jug when adding engine oil through the oil filler to prevent the oil from spilling on the belt or other components.**
- **If the oil has spilled on the belt, quickly wipe it off with a shop towel.**

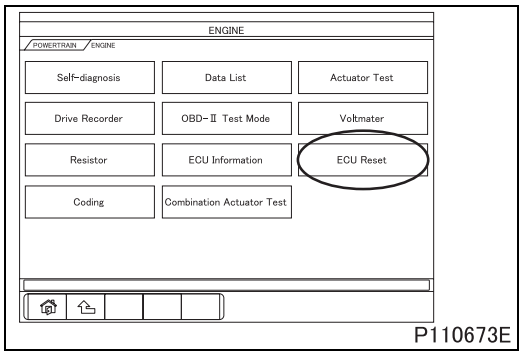
https://truckmanualshub.com/

- Follow the procedure below to crank the engine, and then start the engine to warm it up until the needle of the water temperature gauge begins to move.

[Starting the engine after parking for a long period]

If the vehicle has not been used for more than 1 week, or when the engine oil or oil filter element has been replaced, follow the procedure below to crank the engine, then start the engine.

- Start the engine in the ordinary way. You don't have to wait for the indicator lamp to go off.
- Place the starter switch in the "START" position without pressing the accelerator pedal and crank the engine for about 15 seconds.
- If the engine has started, release the starter key and leave the accelerator pedal unpressed for about 15 seconds.
- Stop the engine. After at least 10 minutes, check the engine oil level.
- Start the engine and check that oil is not leaking.
- Add the engine oil if the oil level is too low.
- When the engine oil has been replaced, reset the inspection/service memory of the multi-information system. (See Chapter 6 "Multi-information system" in the Owner's Manual.)



P110673E

■ Resetting the engine electronic control unit

<Resetting with Multi-Use Tester>

- Connect the Multi-Use Tester to the vehicle.
- Use the "Electronic control unit reset" button in the menu to reset the engine oil parameter in the engine electronic control unit.

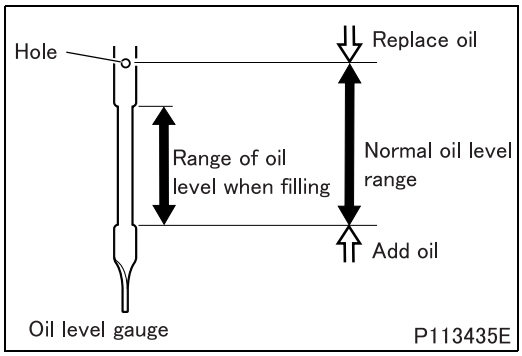
<Resetting without Multi-Use Tester>

- Turn the starter switch to the "ON" position. Do not start the engine.
- Fully press and hold the accelerator pedal for more than 20 seconds.
- With the accelerator held in that position, press the brake pedal 6 times.

- If the electronic control unit resetting is not performed, the engine electronic control unit will keep counting the melting amount in the engine oil even after the engine oil has been replaced, causing a diagnosis code to be generated and a warning lamp (red) to light up. (See Gr13E.)

https://truckmanualshub.com/

3. Inspection of Engine Oil Level



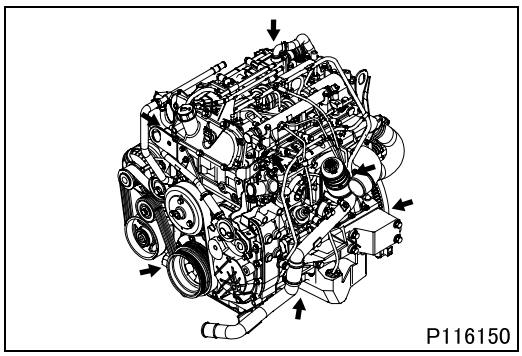
- Inspection should be performed in a level place.
- Warm up the engine until the needle of the water temperature gauge reaches close to the center of the gauge.
- Stop the engine. After at least 10 minutes, measure the engine oil level.
- If the measured oil level is higher than upper side of the hole, it indicates an increase in the oil amount due to such reason that some of the injected fuel has mixed into the engine oil during DPF regeneration. Replace the engine oil.

CAUTION ⚠

- **If the oil level is higher than the upper side of the hole, quality of the engine oil is reduced, which could lead to an engine failure or a sudden increase in the engine speed.**

- If the measured oil level is too low, add oil to a level within the specified oil level range for filling.
- If it is found the engine oil decreases too quickly in daily checks although the measured oil level was inside the normal oil level range, perform an inspection to check for the following causes.
  - Seizure between the piston ring and piston
  - Too much clearance between the piston and crankcase cylinder

4. Inspection of Engine Oil Leaks



- Warm up the engine until the needle of the water temperature gauge reaches close to the center of the gauge.
- Visually check each part of the engine (oil pan, oil filter, cylinder head gasket, etc.) for oil leaks. If oil is leaking, replace the faulty component.

https://truckmanualshub.com/

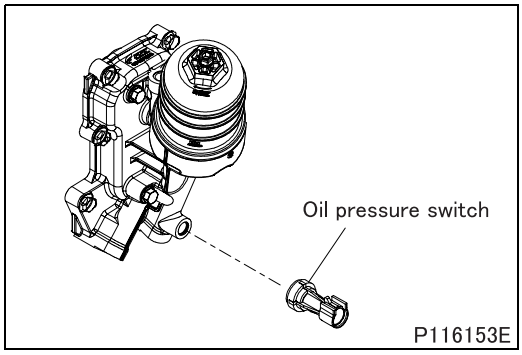
5. Oil Pressure Measurement

Service standards

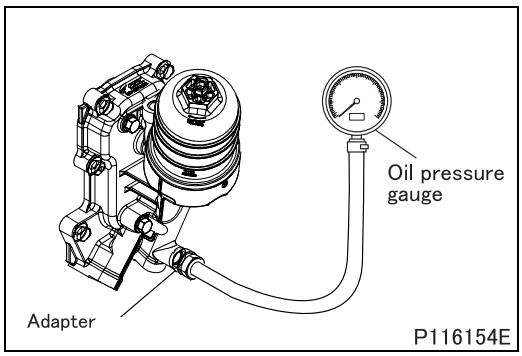
Location	Maintenance item		Standard value	Limit	Remedy
–	Oil pressure (oil temperature at 100 ± 5°C {212 ± 9°F})	No-load minimum speed	100 kPa {15 psi, 1.0 kgf/cm^2}	–	Inspect
		No-load maximum speed	450 kPa {65 psi, 4.6 kgf/cm^2}	–	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Oil pressure switch	25 {18, 2.5}	Sealant With cold engine



- Remove the oil pressure switch.



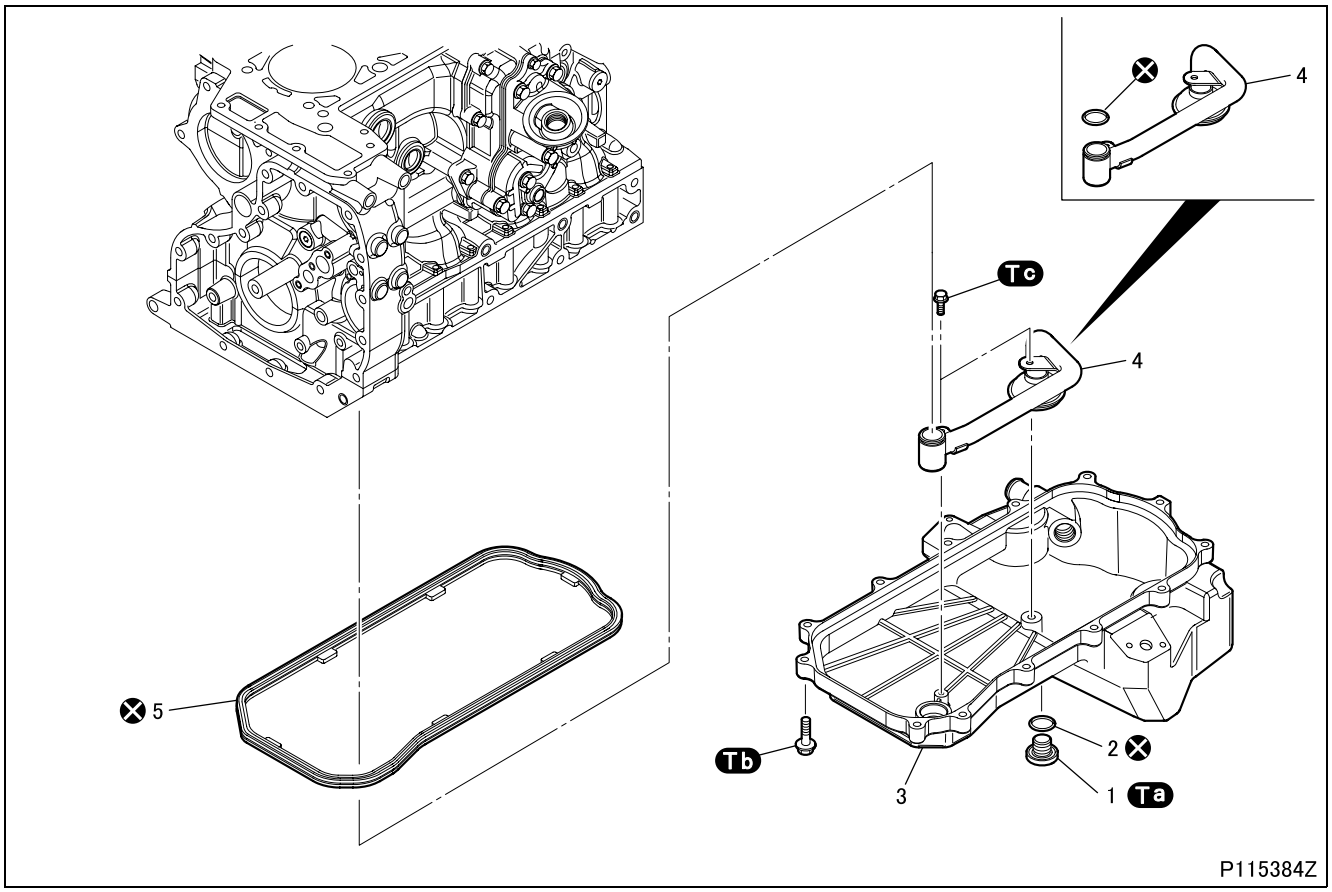
- Using an adapter, connect an oil pressure gauge to the oil pressure switch mounting hole.
- Warm up the engine until the oil temperature reaches 100 ± 5°C {212 ± 9°F}.
- Measure the oil pressure while running the engine at a minimum speed and then at maximum speed, both under no load.
- If the measurements are below the specified limits, overhaul the lubrication system.
- Tighten the engine oil pressure switch to the specified torque.

CAUTION ⚠

- **Reinstall the oil pressure switch only when the engine is cold.**

https://truckmanualshub.com/

OIL PAN, OIL STRAINER



● **Removal sequence**

1 Oil drain plug
2 O-ring
3 Oil pan
4 Oil strainer
5 Gasket

⊗: Non-reusable parts

● **Installation sequence**

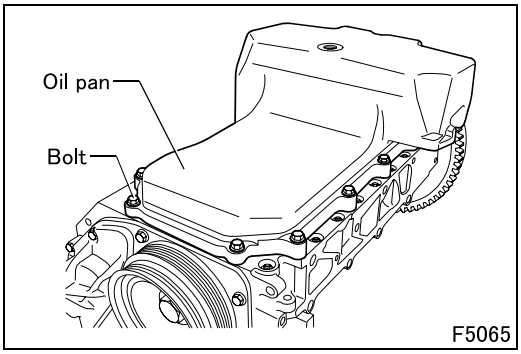
Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Oil drain plug	20 {15, 2.0}	–
Tb	Bolt (oil pan mounting)	25 {18, 2.5}	–
Tc	Screw (oil strainer mounting)	10 {7.4, 1.0}	–

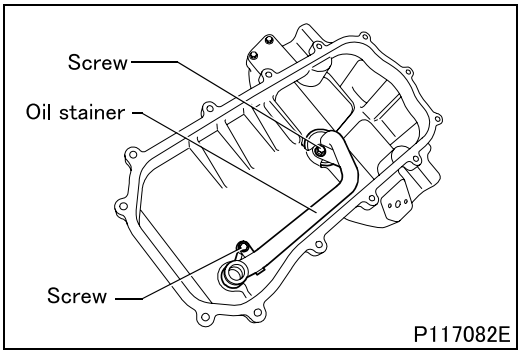
https://truckmanualshub.com/

◆Removal procedure◆



■ **Removal: Oil pan**

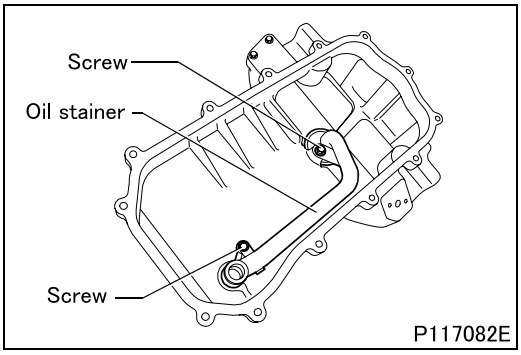
- Take out the bolts and remove the oil pan.



■ **Removal: Oil strainer**

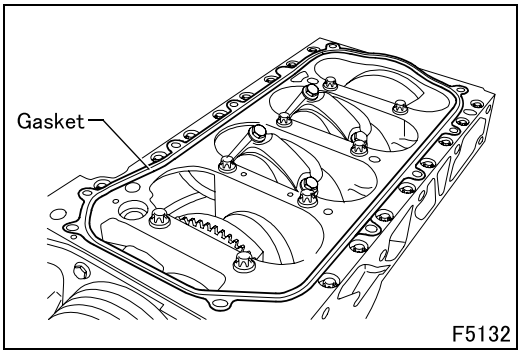
- Unscrew and remove the fixing screws.
- Detach the oil strainer from the oil pan.

◆Installation procedure◆



■ **Installation: Oil strainer**

- Mount the suction strainer together with the pipe.
- Screw down the fixing screws and tighten them to the prescribed torque 10 N·m {7.4 ft.lbs, 1.0 kgf·m}.

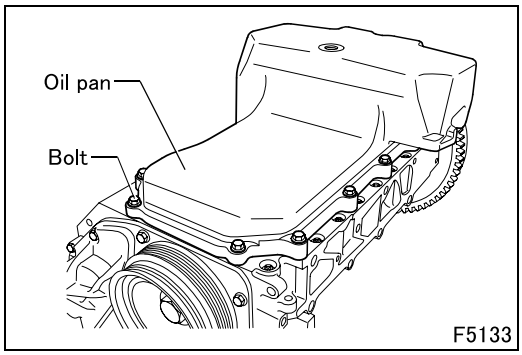


■ **Installation: Oil pan**

- Position the gasket on the engine block.

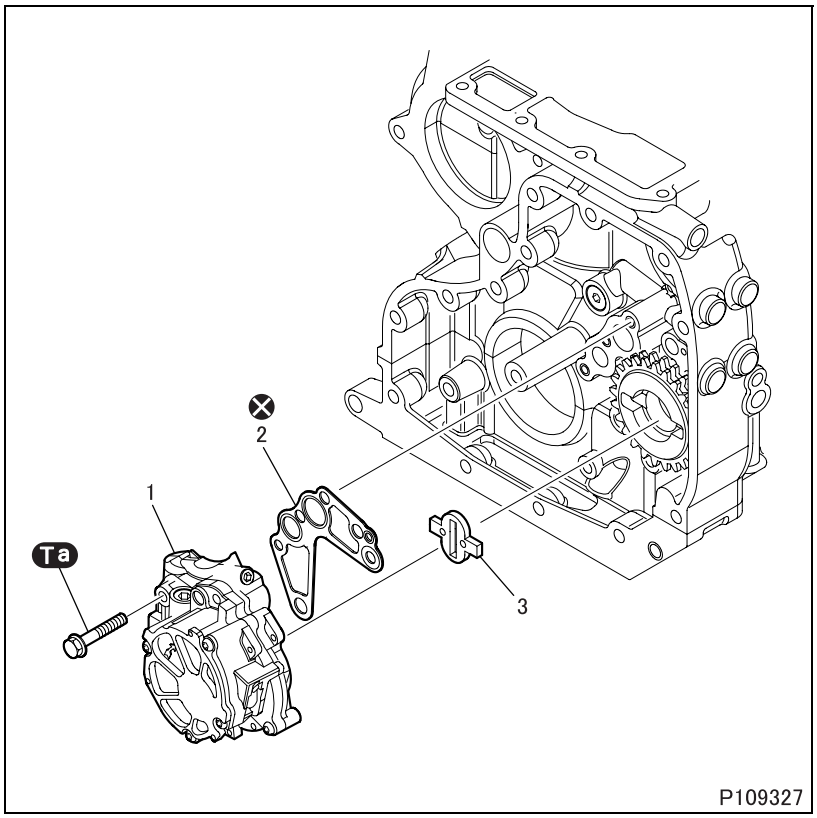
https://truckmanualshub.com/

OIL PAN, OIL STRAINER



- Fit the oil pan and tighten the fixing bolts to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.
- Tighten the oil drain plug to a torque of 20 N·m {15 ft.lbs, 20 kgf·m}.

https://truckmanualshub.com/



● **Removal sequence**

1 Oil pump/vacuum unit
2 Gasket
3 Coupling

⊗: Non-reusable parts

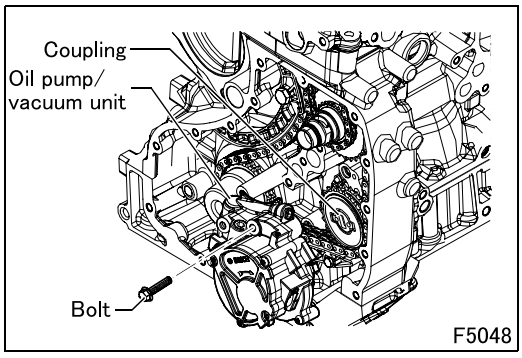
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (oil pump/vacuum unit mounting)	25 {18, 2.5}	–

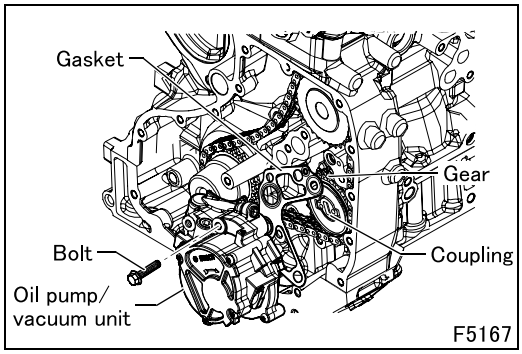
◆Removal procedure◆



■ **Removal: Oil pump/vacuum unit**

- Remove the bolt and then remove the oil pump/vacuum unit.
- Remove the coupling.

◆Installation procedure◆

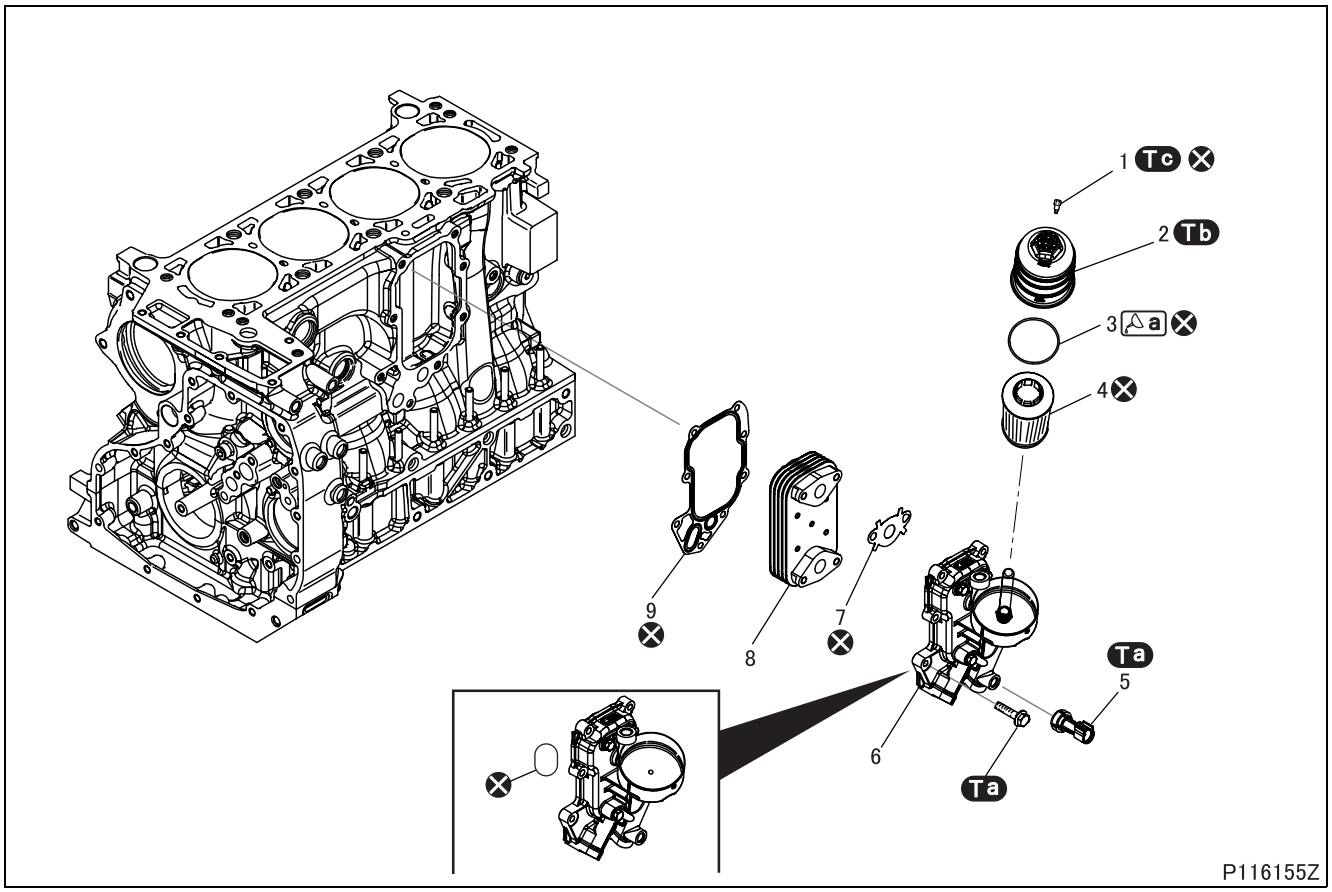


■ **Installation: Oil pump/vacuum unit**

- Position the coupling in the gear.
- Fit the oil pump/vacuum unit placing a new gasket in between.
- Screw in the bolts placing the oil pump/vacuum unit assembly in the end of travel position and check it is correctly fitted on the coupling.
- Tighten the bolts to the recommended torque 25 N·m {18 ft.lbs, 2.5 kgf·m}.

https://truckmanualshub.com/

OIL FILTER, OIL COOLER



● **Disassembly sequence**

1 Air bleeder plug
2 Oil filter case
3 O-ring
4 Oil filter element
5 Oil pressure switch
6 Oil filter support
7 Gasket
8 Oil cooler
9 Gasket

⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING ⚠

- **Wipe up any spilled engine oil, as it can cause fires.**
- **To avoid any risk of burns, take care not to touch the engine oil when the engine is hot.**

CAUTION ⚠

- **Make sure not to put any engine oil on the belt when working on the oil filter. Belts soiled with oil may easily slip, resulting in deteriorated performance of the cooling system.**
- **Be sure to attach the gasket in the right direction shown in the figure. Otherwise, the oil holes will be covered.**
- **Do not reuse oil filters by washing them.**

https://truckmanualshub.com/

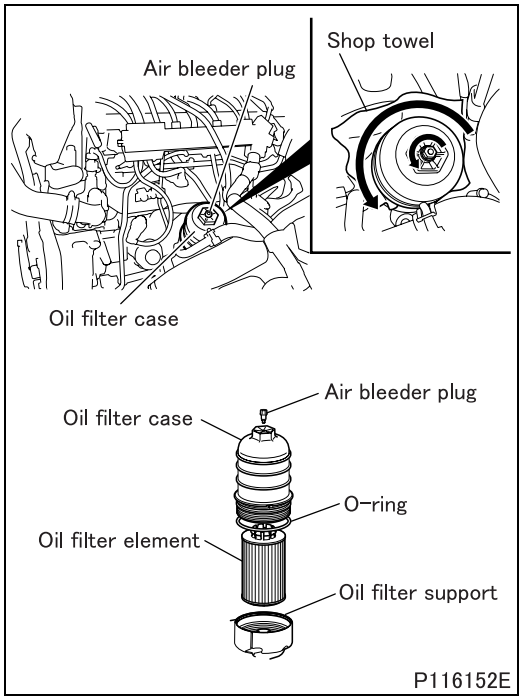
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (oil filter support mounting)	25 {18, 2.5}	–
	Oil pressure sensor		
Tb	Oil filter case	25 to 30 {18 to 22, 2.5 to 3.0}	–
Tc	Air bleeder plug	1.5 ± 0.6 {1.1 ± 0.4, 0.2 ± 0.1}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring	Engine oil	As required

◆Removal procedure◆



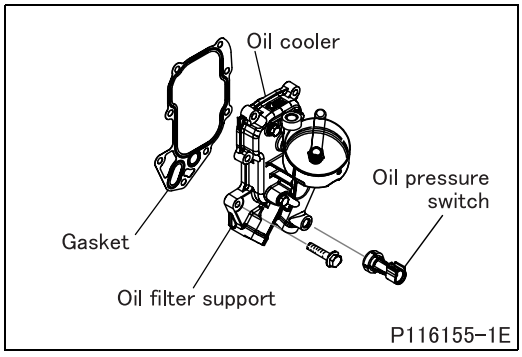
■ Removal: Oil filter element

- Warm up the engine if it is cold.
  Let the engine oil temperature rise to about 40°C {104°F}. (Run the engine at idle for about 20 min. to increase the engine oil temperature from about 0°C to 40°C {0°F to 104°F}.) Without warming up the engine, the engine oil will come out when the oil filter case is removed.
- Loosen the oil filter case. (Approx. 2.5 rotations.)
- Remove the air bleeder plug from the oil filter case. Wait for at least 5 minutes to drain the engine oil in the oil filter case.
- Remove the oil filter case.
  Wrap up the oil filter case with a rag when removing it so that oil will not spill out.

CAUTION ⚠

- **After removing the oil filter case, be careful not to allow foreign objects to enter the oil filter case.**

- Remove the O-ring from the oil filter case.
- Remove the oil filter element from the oil filter support.
- Clean the oil filter case, oil filter support surface that contacts the O-ring, and the O-ring groove on the filter case with a rag.

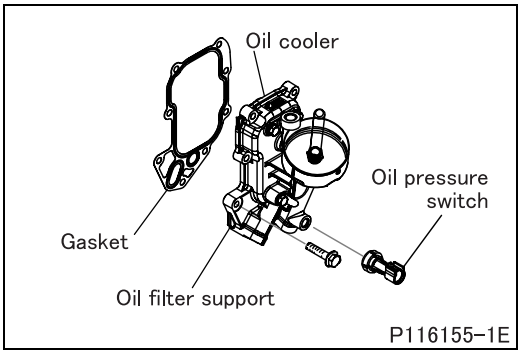


■ Removal: Oil cooler and oil cooler support

- Remove the oil cooler support together with the oil cooler and gasket.

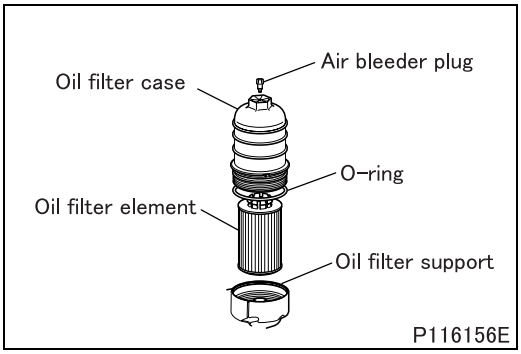
https://truckmanualshub.com/

◆Installation procedure◆



■ **Installation: Oil cooler support and oil cooler**

- Install the oil cooler together with a new gasket on the crankcase.
- Coat the oil pressure switch with sealant and install it.



■ **Installation: Oil filter element**

- Apply a thin coat of engine oil to a new O-ring and install the O-ring on the oil filter case.

CAUTION ⚠

- **Use the O-ring and air bleeder plug that came with a new oil filter element.**

- Install an oil filter element with its hole located on the bottom side.
- Install a new air bleeder plug on the oil filter case, and then install the oil filter case on the oil filter support.

CAUTION ⚠

- **Use care not to tighten the air bleeder plug to a torque more than the specified. Otherwise, the air bleeder plug can be damaged.**

- Following the procedure given in the section “Starting the engine after parking for a long period,” start the engine and warm it up until the needle of the water temperature gauge begins to move.

- Stop the engine. After at least 10 minutes, check the engine oil level.
- Start the engine and check that oil is not leaking.
- If any abnormality is found, reinstall the oil filter.
- Stop the engine and check the engine oil level.
- Add engine oil if the oil level is too low.

- When the engine oil has been replaced, reset the inspection/service memory of the multi-information system. (See Chapter 6 “Multi-information system” in the Owner’s Manual.)

https://truckmanualshub.com/

Fuels

- In cold regions, use diesel fuel with properties appropriate for the temperature predominant in the area.
- Use of a type of fuel other than the type indicated above will result in poor engine performance and could lead to serious damage to the engine. This also causes the warning lamp (red) to flash, which may result in limited engine power output or poor starting ability.
  If the warning lamp (red) flashes, have the vehicle inspected at an authorized dealer or distributor as soon as possible.

WARNING ⚠

- **Never use a mixture of diesel fuel with gasoline or alcohol or any fuel other than proper diesel fuel. Using other fuel could cause a fire or an explosion. If you accidentally use gasoline or alcohol when refueling the vehicle, remove all of it from the fuel system.**
- **The engine must be stopped when refueling. Never fail to put out your cigarette before refueling if you are smoking.**

CAUTION ⚠

- **Never use an alternative fuel or a mixture of diesel fuel and kerosene. Such fuel has inferior lubricating properties. Using it would cause a malfunction.**
- **Never add any antifreezing agent or other additive to the fuel, as a damaged fuel injection system could result.**

NOTE

- **If the vehicle runs out of fuel, air will enter the fuel system. Once air enters the system, you cannot start the engine even after refueling. The air must be bled out of the fuel system before the engine can be started. To bleed the fuel system, hold the starter switch in the "ON" position for 30 seconds and then return it to the "ACC" position. Fuel will then flow into the fuel system while forcing the air out. Now you can start the engine. There may be some instances where it takes 30 to 60 seconds to start the engine.**

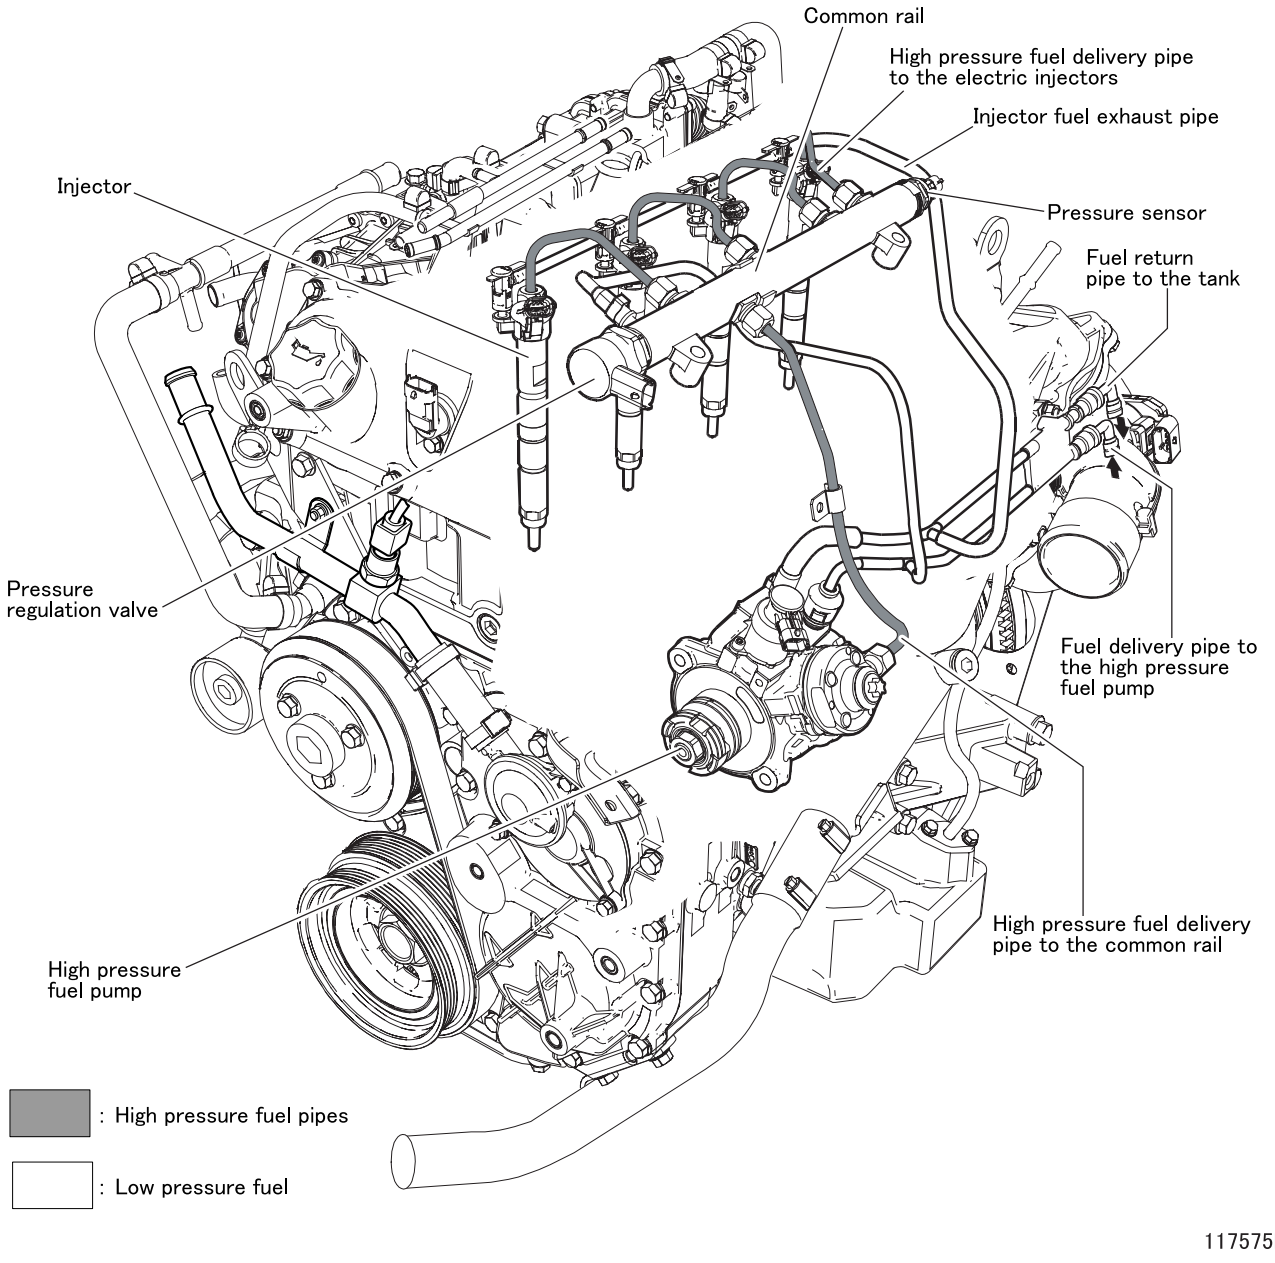
1. High Pressure Electronic Injection System

1.1 Over view

- The main characteristics of high pressure electronic injection system are:
  - High injection pressures available;
  - Pressures can be modulated irrespective of the speed of rotation and engine load;
  - Capacity to operate at very high speeds;
  - Injection control precision (injection duration and advance);
  - Lower consumption;
  - Lower emissions.



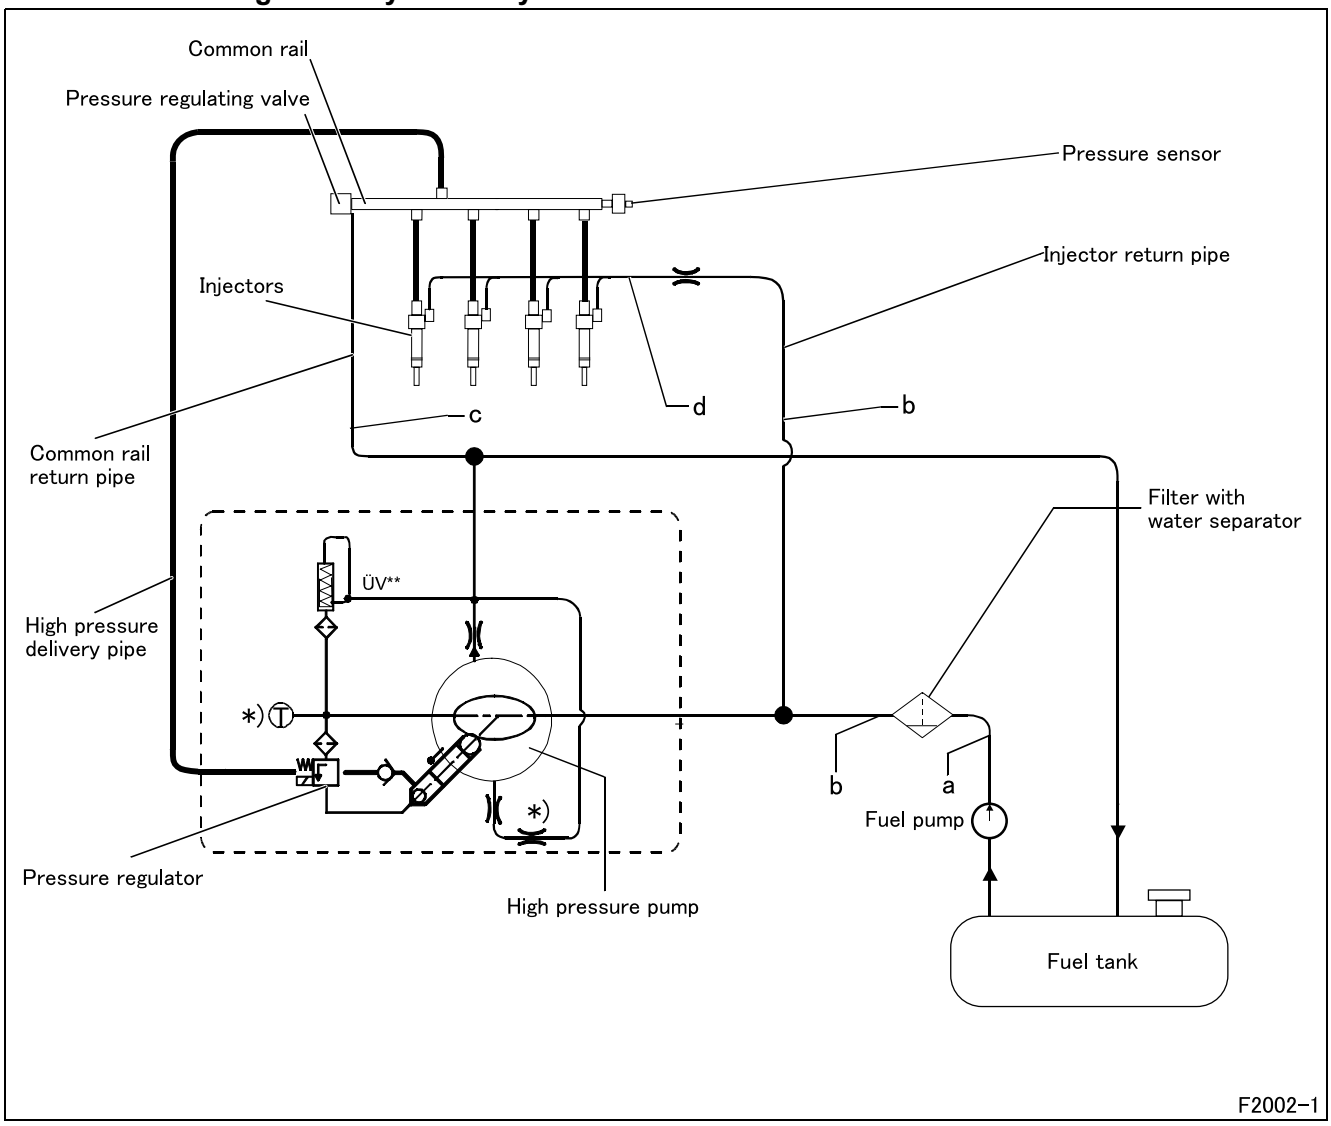
https://truckmanualshub.com/

- The main functions of the system are basically as follows:
  - Checking fuel temperature;
  - Checking engine coolant temperature;
  - Checking amount of fuel injected;
  - Checking idling speed;
  - Fuel cut-off when the accelerator pedal is released;
  - Checking cylinder balancing when idling;
  - Checking smokiness at exhaust on acceleration;
  - Checking exhaust gas recirculation (E.G.R.);
  - Checking top speed limit;
  - Checking glow plugs;
  - Checking activation of air-conditioning system (if any);
  - Checking auxiliary fuel pump;
  - Checking position of cylinders;
  - Checking main and pilot injection advance;
  - Checking closed cycle of injection pressure;
  - Checking turbocharging pressure;
  - Self-diagnosis;
  - Immobilizer electronic control unit;
  - Maximum torque limitation.

- The information the engine electronic control unit processes to regulate the amount of fuel to be injected comprises:
  - Engine speed;
  - Coolant temperature;
  - Turbocharging pressure;
  - Air temperature;
  - Intake air quantity;
  - Battery voltage;
  - Fuel pressure;
  - Position of throttle pedal.

https://truckmanualshub.com/

1.2 Functional diagram of hydraulic system



Pressures within the circuit:

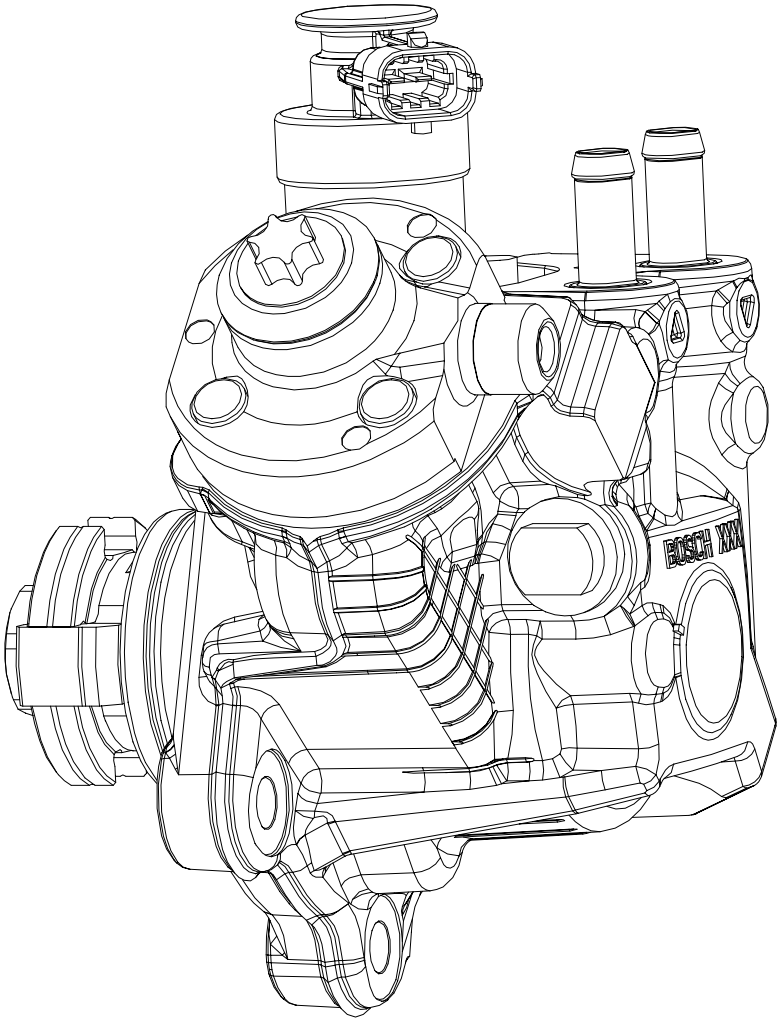
a. 0.44 MPa {64 psi, 4.49 kgf/cm^2} (relative) ≤ p ≤ 0.58 MPa {84 psi, 5.91 kgf/cm^2} (relative)
b. 0.44 MPa {64 psi, 4.49 kgf/cm^2} (absolute) ≤ p ≤0.6 MPa {87 psi, 6.12 kgf/cm^2} (absolute)
c. p ≤ 0.2 MPa {29 psi, 2.04 kgf/cm^2} (absolute)
d. p ≥ 1.0 MPa {145 psi, 10.20 kgf/cm^2}

https://truckmanualshub.com/

- In this injection system, the pressure regulator, located upstream from the high pressure fuel pump, governs the flow of fuel needed in the low-pressure system. Afterwards, the high pressure fuel pump correctly supplies the common rail.
- This solution, pressurizing solely the necessary fuel, improves the energy efficiency and limits heating the fuel in the system.
- The pressure regulator valve fitted on the high pressure fuel pump has the function of keeping the pressure, at the pressure regulator inlet, constant at; irrespective of the efficiency of the fuel filter and of the system upstream. The action of the relief valve causes an increase in the flow of fuel in the high pressure fuel pump cooling circuit.
- The high pressure fuel pump continually keeps the fuel at the working pressure, irrespective of the timing and the cylinder that is to receive the injection and accumulates it in a duct common to all the injectors.
- At the injector inlet, there is therefore always fuel at the injection pressure calculated by the electronic control unit.
- When the piezoelectric actuator of the injector is energized by the electronic control unit, fuel flows in from the common rail and is injected into the cylinder.
- The hydraulic system is consists of a low-pressure fuel recirculation circuit and a high pressure circuit.
- The high pressure circuit is made up of the following pipes:
  - pipe connecting the high pressure fuel pump outlet to the common rail;
  - common rail;
  - pipes feeding the injectors from the common rail.
- The low-pressure circuit is made up of the following pipes:
  - fuel intake pipe from the tank to the filter;
  - pipe assembly made up of the following:
    - feed pipe from the fuel filter to the high pressure fuel pump;
    - fuel return pipe from the high pressure fuel pump to the tank;
    - fuel exhaust pipe from the injectors to the fuel return pipe to the tank.
- Because of the high performance of this hydraulic system, for reasons of safety it is necessary to:
  avoid connecting high pressure fuel pipe fittings without fully tightening the fittings;
  never disconnect the high pressure fuel pipes with the engine running (NEVER try bleeding, which is both pointless and dangerous).
- The integrity of the low-pressure circuit is also essential for the system to work properly; it is therefore necessary to avoid all manipulation and modifications and act only in the event of leakage.

https://truckmanualshub.com/

1.3 High pressure fuel pump

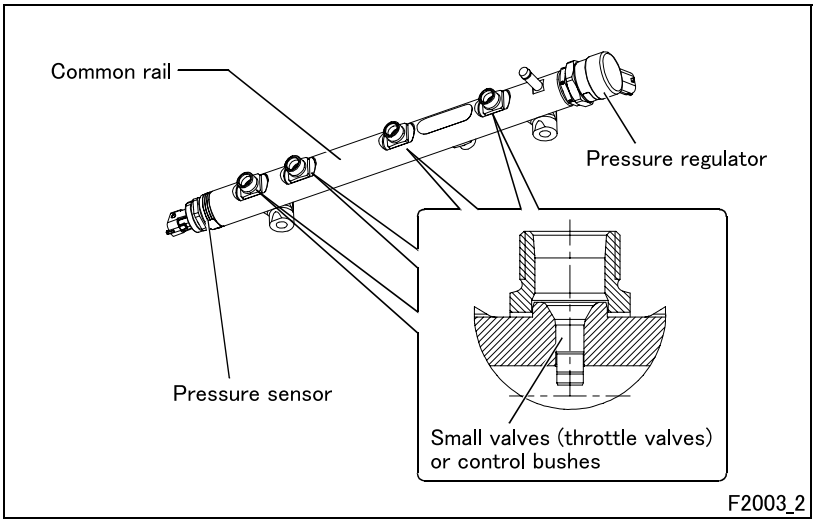


F2003

- A radial piston mechanical pump (CP 4.1) driven by distribution drive chain is used to produce a high level of operating pressure.
- The operating pressure is controlled in the following ways.
  - Electronically via a solenoid fixed to the pump body and controlled by the engine electronic control unit;
  - Via a pressure regulating valve mounted on the common rail.
- Fuel is supplied by the transfer pump located inside the high-pressure fuel pump body. The transfer pump is equipped with a pressure regulator that is controlled by the electronic control unit to meter the amount of fuel sent to the high-pressure fuel pump.

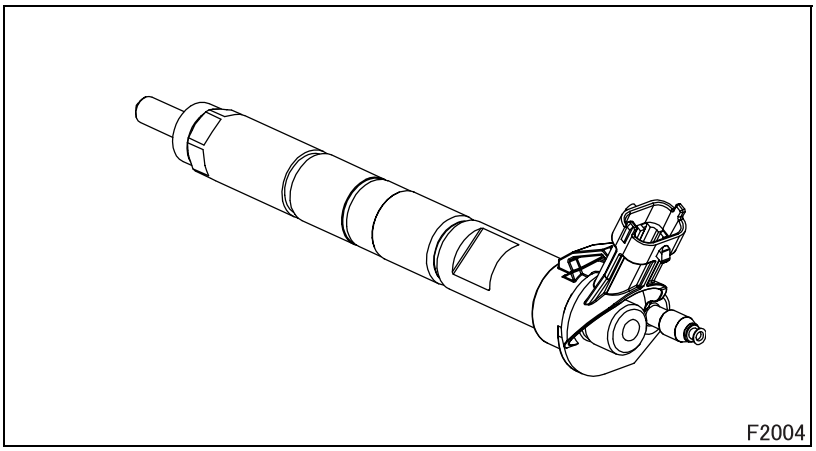
https://truckmanualshub.com/

1.4 Common rail



- The common rail is affixed to the cylinder head on the intake side.
- By its volume, it dampens fuel pressure oscillations caused by:
  - High pressure fuel pump operation
  - Injector opening.
- The following are installed on common rail:
  - A pressure sensor to measure the pressure of the fuel present inside the common rail. The fuel pressure sensor can affect the accuracy of the injector minimum flow correction, as the minimum flow depends on both the injection times and the actual pressure of the common rail.
  - A pressure regulator to control the operating pressure.
- Small valves (throttle valves) or control bushes, have been installed on the fuel delivery couplings, which control the fuel pressure waves generated by the high pressure fuel pump.
- Their function is to protect the injectors by reducing their wear over time.

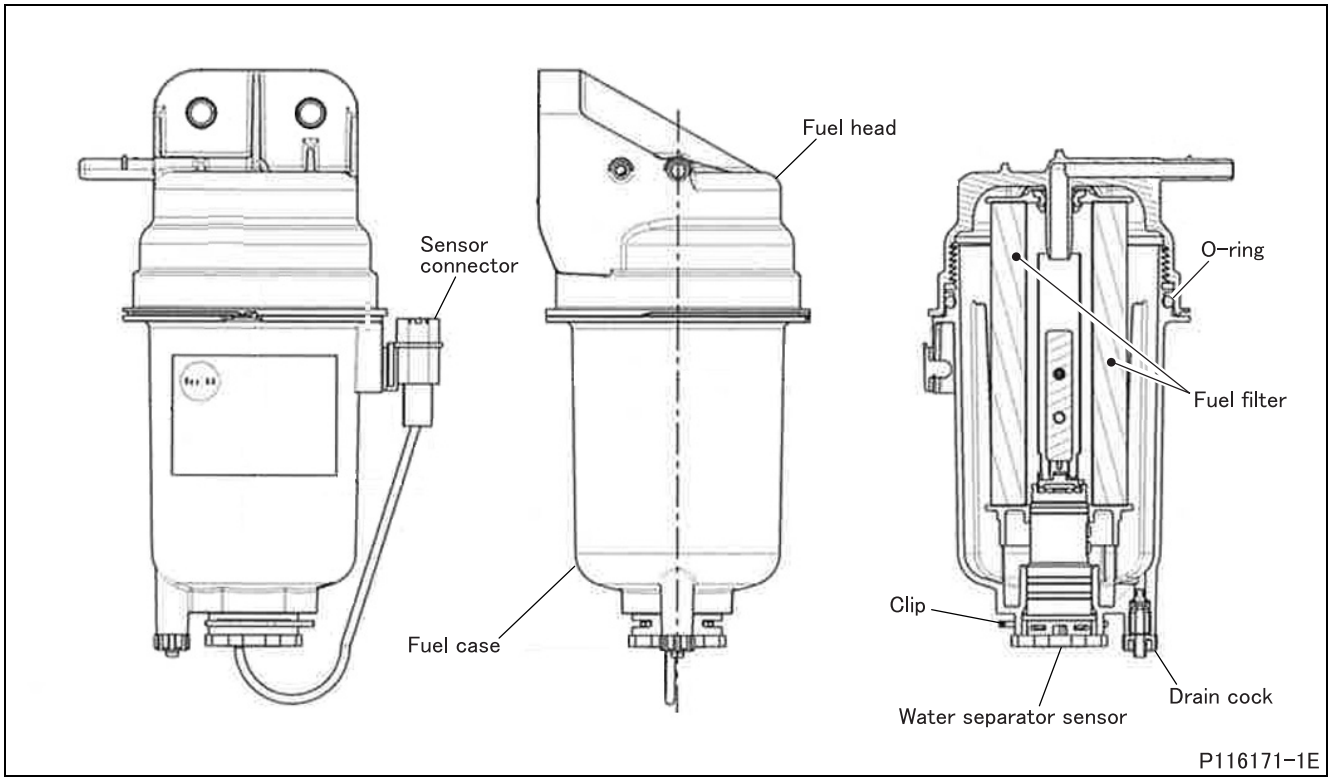
1.5 Injectors



- The injectors are located on the cylinder head and receive the fuel under pressure from the common rail. They operate both the high pressure fuel supply and recirculation under atmospheric pressure of the excess fuel that has not been injected.
- The following are installed on the injector head:
  - A central access pipe for fuel under high pressure;
  - A lateral pipe for the recirculation of fuel under low pressure with built-in throttle;
  - The site for the electric connector that receives commands from the engine electronic control unit.
- The engine electronic control unit controls the piezoelectric actuator inside the injector.
- The piezoelectric actuator, due to reduced switching times, enables a very fast reaction to the commands sent from the electronic control unit, making injection capacity more flexible and increasing the number of injections per cycle.

https://truckmanualshub.com/

1.6 Fuel filter



- Fuel filter is made up of a filtering cartridge with water separator, inside which an electronic unit is housed. Water accumulation capacity is equal to 140 cm^3 {8.5 cu.in.}. The electronic unit includes water separator sensor and fuel temperature sensor.

(1) Water presence sensor

Water presence sensor detects water present in the filter starting from 110 cm^3 {6.7 cu.in.} volume present. Water presence sensor provides values of:

- low voltage in presence of water: higher than 11.8 V
- high voltage in absence of water: lower than 3.9 V

Characteristics
12 V nominal voltage (8 V minimum – 16 V maximum)

(2) Fuel temperature sensor

Temperature range: –40 to +130°C {–104 to 266°F}

(3) Heater

Nominal voltage: 12 V
Maximum allowed voltage: 30 V
Nominal power: 250 W

ON-VEHICLE INSPECTION AND ADJUSTMENT

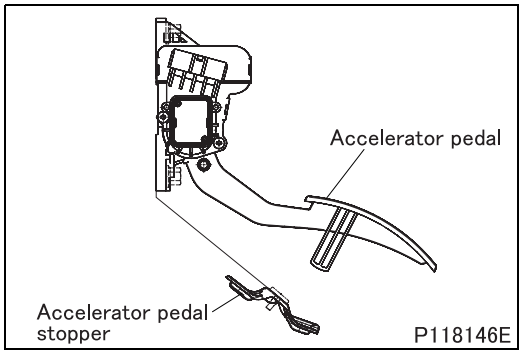
1. Inspecting and Adjusting No-load Minimum and Maximum Speeds

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	No-load minimum speed (idle speed)	650 rpm	–	Inspect
–	No-load maximum speed	4200 ± 50 rpm	–	Inspect

[Preparation]

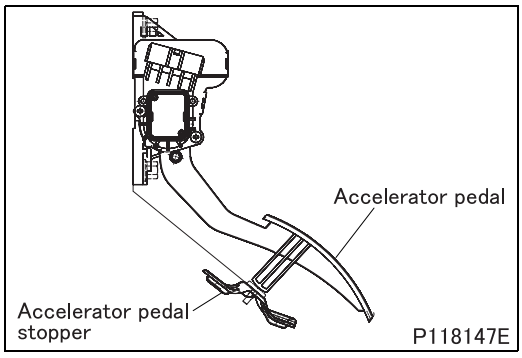
- Prepare the vehicle for inspection and adjustment as described below.
- Connect a tachometer or FUSO diagnostics. (Confirm this with the service data “Coolant Temperature” in FUSO diagnostics.)
- Warm-up the engine until the engine coolant temperature rises to 84 to 94°C {176 to 201°F}. (Confirm this with the service data “Coolant Temperature” in FUSO diagnostics.)
- Turn off all the lights and auxiliary equipment.
- Put the transmission into neutral.
- Turn the steering wheel to the neutral position.
- Set the rev counter.



[Inspection]

(1) No-load minimum speed

- Measure the engine speed when the accelerator pedal is not depressed.
- If the measurement deviates from the standard range, check the accelerator pedal position sensor for malfunction. (See “ACCELERATOR PEDAL”.)
- If no abnormality is found in the accelerator pedal position sensor, check for fuel system diagnosis codes and inspect the fuel system.



(2) No-load maximum speed

- Make sure the pedal’s stopper comes in contact with the stopper rubber when the pedal is depressed a full stroke.
- Press the accelerator pedal all the way.
- Measure the engine speed when the accelerator lever is in contact with the accelerator pedal stopper.
- If the measurement deviates from the standard range, check the accelerator pedal position sensor for malfunction. (See “ACCELERATOR PEDAL”.)
- If no abnormality is found in the accelerator pedal position sensor, check the fuel system diagnosis codes and inspect the fuel system.

https://truckmanualshub.com/

2. Air-bleeding of Fuel System

- If the vehicle runs out of fuel, air will enter the fuel system. Once air enters the system, you cannot start the engine even after refueling. The air must be bled out of the fuel system before the engine can be started. To bleed the fuel system, hold the starter switch in the “ON” position for 30 seconds and then return it to the “ACC” position. Fuel will then flow into the fuel system while forcing the air out. Now you can start the engine. There may be some instances where it takes 30 to 60 seconds to start the engine.

3. Fuel Filter Replacement

WARNING ⚠

- **The fuel is highly flammable. Keep it away from flames and other sources of heat.**
- **Carefully wipe up spilled fuel. Otherwise, it could cause a fire.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

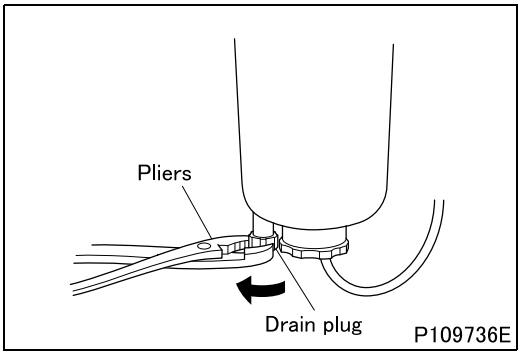
Mark	Parts to be tightened	Tightening torque	Remarks
–	Drain plug of filter case	1.5 ± 0.5 {1.1 ± 0.4, 0.15 ± 0.05}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	O-ring	Engine oil	As required

Special tools

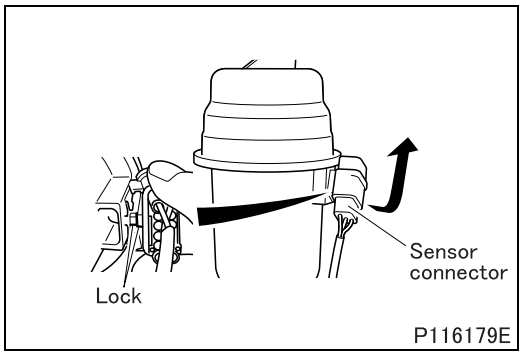
Mark	Tool name and shape	Part No.	Application
Ca	Filter wrench  P116182	MH064193	Removal and installation of filter case



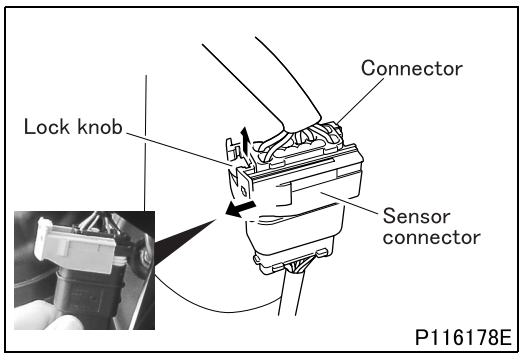
[Removal]

- Place a container below the fuel filter to catch fuel.
- Disconnect the fuel tube and turn the fuel filter drain plug in the illustrated direction with pliers or equivalent to loosen it. The fuel in the fuel filter will drain.
- After the fuel is drained, tighten the drain plug to the specified torque.

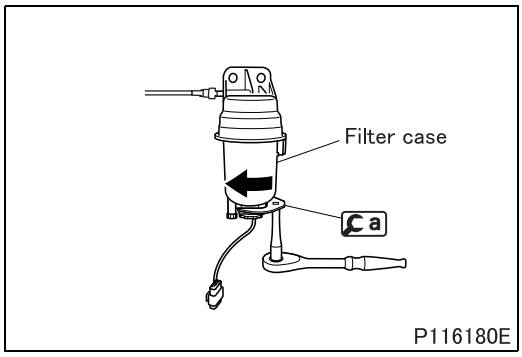
https://truckmanualshub.com/



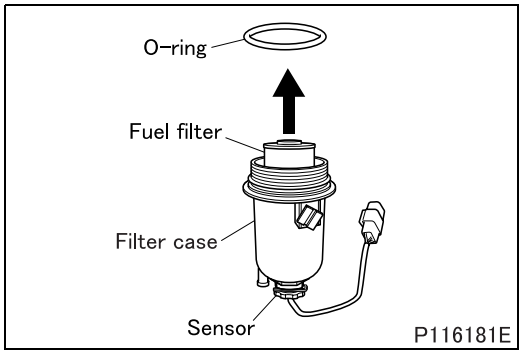
- Unlock the sensor connector by pulling its bottom toward you, then pull the connector straight upward to remove it.



- Pull up the sensor connector's lock knob, then slide the upper half of the connector (in the direction of the arrow) to remove the connector.



- Remove the filter case using a.



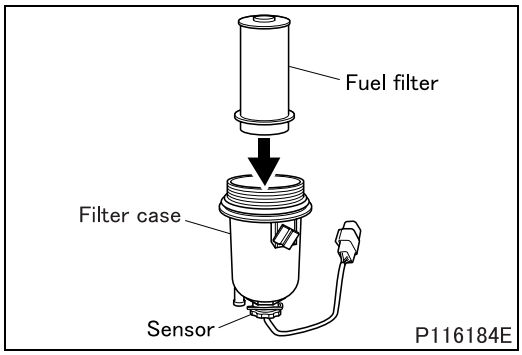
- Remove the fuel filter by pulling it straight upward.

CAUTION ⚠

- **Always keep the filter parallel with the filter case when removing and installing it. The sensor will be damaged if the filter is tilted during its installation or removal.**

- Remove the O-ring from the filter case.

https://truckmanualshub.com/

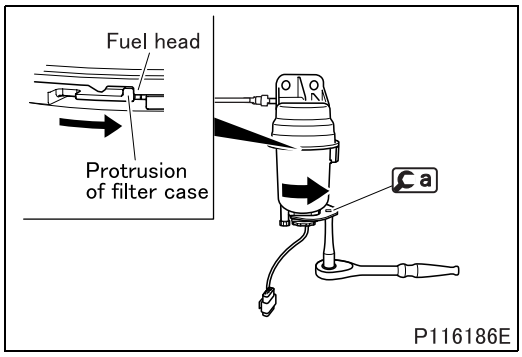


[Installation]

- Replace the fuel filter and O-ring with new ones.
- O-ring used should be the one supplied with a new fuel filter.
- Coat the O-ring with a thin film of [a] and install it on the filter case.
- Insert the fuel filter into the filter case straight downward.

CAUTION ⚠

- **Always keep the filter parallel with the filter case when removing and installing it. The sensor will be damaged if the filter is tilted during its installation or removal.**
- **Use of an unsuitable fuel filter causes engine trouble. Always use a genuine fuel filter.**
- **Take care not to allow foreign particles to enter the fuel filter and fuel tube. Otherwise, injection failure or other trouble could occur.**



- Turn the filter case using [a] until it stops and check that the projection on the filter case is in contact with the filter head.

CAUTION ⚠

- **When installing the filter case, always make sure that the protrusion on it is in close contact with the filter head.**
- **Leaky or damaged filter case will result if it is turned insufficiently or excessively during the installation.**

■ Installation: Sensor connector

- To install the sensor connector, follow the removal procedure in reverse. (See "**■ Removal: Sensor connector**".)

■ Work after installation

- Bleed air out of the fuel system after installing the filter case. (See Air-bleeding of Fuel System.)
- Start the engine and confirm that fuel does not leak.
- If fuel leaks, remove and reinstall the fuel filter from the beginning.
- After replacement of the fuel filter, reset the maintenance record in the multi-information system. (See Chapter 6 "Multi-information system" of Owner's Manual.)

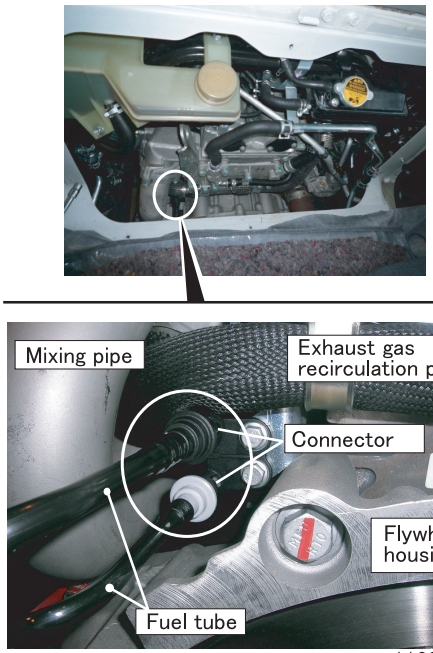
https://truckmanualshub.com/

4. Fuel Hose Replacement

Special tools

Mark	Tool name and shape	Part No.	Application
a	Fuel tube release tool  P116339	MH064211	Removal of fuel tube

◆Removal procedure◆

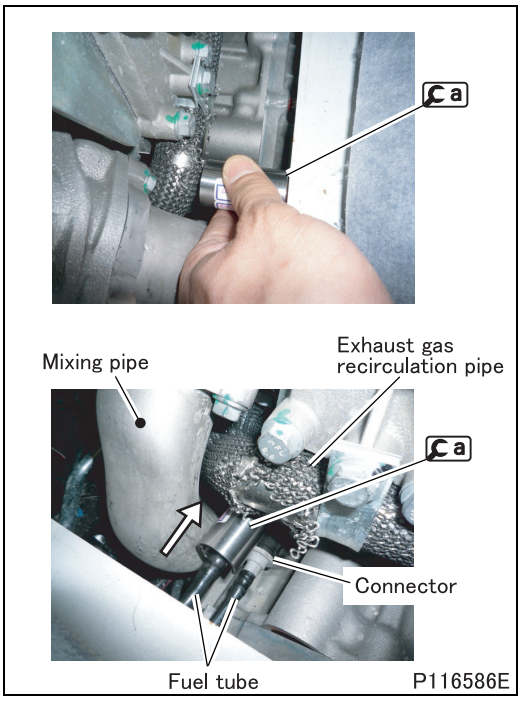


116340-1E

■ **Removal: Fuel tube**

- Disconnect the fuel tube at the connection to the engine using a.
- The connector has different diameters depending on whether it is outgoing to, or incoming from, the engine. Use a of the correct size according to the connector type.

https://truckmanualshub.com/



- Unlock the connector by pushing it in the direction of the arrow using a inserted from the connector's back side, then remove the fuel tube.
- Perform the same steps for the lower side. Depending on the vehicle specifications, the steps should be performed with the rear lid opened.

◆Removal procedure◆

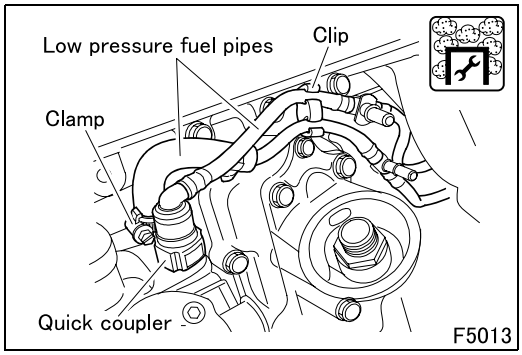
■ Removal: High pressure fuel pipe

: This work requires protection against dust.

- Unscrew the connector on the common rail.
- Unscrew the connector on the high pressure fuel pump.
- Undo and remove the bolt of the high pressure fuel pipe bracket. Remove the high pressure fuel pipe.



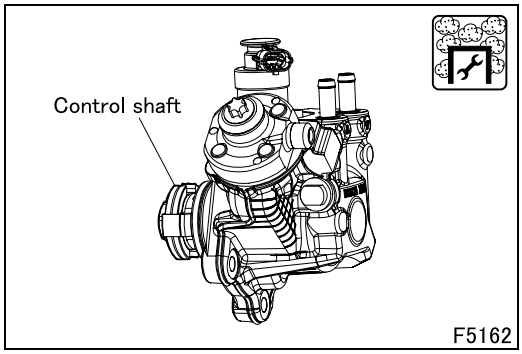
■ Removal: Low pressure fuel pipe

: This work requires protection against dust.

- To remove the low pressure fuel pipes from the high pressure fuel pump it is necessary to loosen the clamp, remove the quick coupler and detach the pipes from the clip.

https://truckmanualshub.com/

◆Installation procedure◆



■ **Installation: High pressure fuel pump**

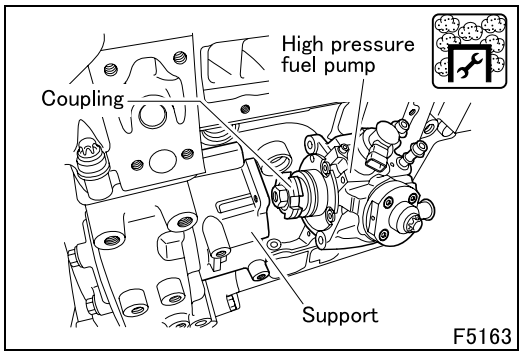
: This work requires protection against dust.

- The relative position between the control shaft and the pump axis is determined by the flange fitted on the high pressure fuel pump.

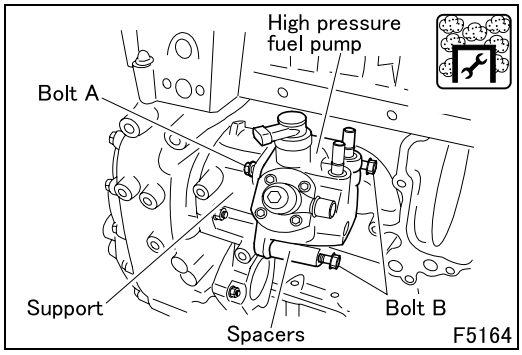
NOTE

- **If a new high pressure fuel pump is required it comes from Bosch in a stable balanced position (at BDC) with the flange installed.**

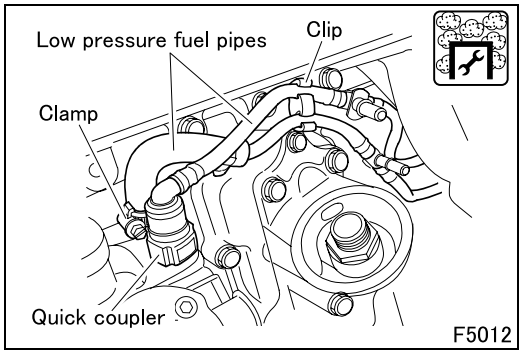
- If the high pressure fuel pump is not replaced, it should be placed in the stable balanced position (at BDC) turning the control shaft appropriately.



- Install the high pressure fuel pump so that the control shaft teeth mesh in the coupling.
- Rotate the high pressure fuel pump (keeping the shafts and the gears locked) so that the openings are aligned with the ones on the support.



- Fully tighten the attaching bolt on the pump support side. Tighten the three attaching bolts complete with spacers in their seats. Tighten the three bolts to a torque of 25 N·m {18.0 ft.lbs, 2.5 kgf·m}.
- Tighten the bolt to a torque of 10 N·m {7.4 ft.lbs, 1.0 kgf·m}.

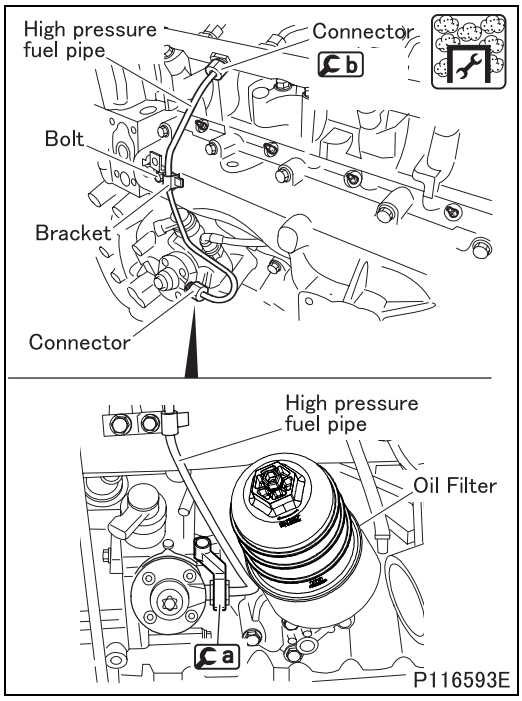


■ **Installation: Low pressure fuel pipe**

: This work requires protection against dust.

- Install the quick couplers to the high-pressure fuel pump, connect the low-pressure fuel pipes, and install the clamps.
- Secure the low-pressure fuel pipes by fitting them in the clips.

https://truckmanualshub.com/



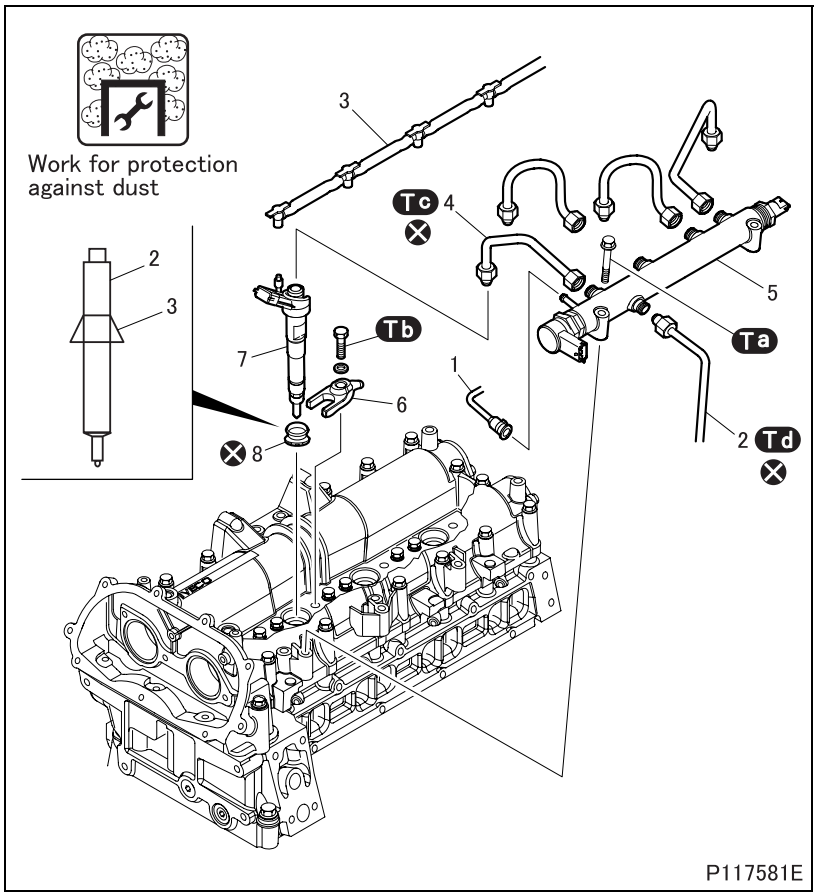
■ **Installation: High pressure fuel pump**

: This work requires protection against dust.

- Install the high pressure new fuel pipe.
- Secure the bracket to the intake manifold using of the bolt. Tighten the bolt to a torque of 25 N·m {18.0 ft.lbs, 2.5 kgf·m}.
- Screw the connector in the high pressure fuel pump and tighten it to a torque of 19 ± 2 N·m {14.0 ± 1.5 ft.lbs, 1.9 ± 0.2 kgf·m} using a.
- Screw the connector in the common rail and tighten it to a torque of 19 ± 2 N·m {14.0 ± 1.5 ft.lbs, 1.9 ± 0.2 kgf·m} using b.

https://truckmanualshub.com/

COMMON RAIL, INJECTOR



● **Removal sequence**

1. Fuel return pipe
2. High pressure fuel pipe (See high pressure fuel pump.)
3. Low pressure fuel return pipe
4. Fuel pipe
5. Common rail
6. Injector bracket
7. Injector
8. Dust guard

⊗: Non-reusable parts

: This work requires protection against dust.

- Dust entering the high-pressure fuel pump will seriously affect engine performance. Cap or cover every opening after removing a pipe or other component.

WARNING ⚠

- **Fuel is highly flammable. Do not handle it near flames or heat.**
- **Spilled fuel may catch fire and therefore, must be wiped off completely.**

CAUTION ⚠

- **It dust enters the common rail, the engine performance will be greatly affected. To prevent it, be sure to cover up openings left after pipes and other parts are removed. Also, wash eyebolts, gaskets, etc. in light oil to clear of dirt.**
- **The common rail and the injector are non-disassembly components. When they has any problems, replace them.**

NOTE

- **If an injector or common rail was replaced with a new component, the data must be written and reset in the engine electronic control unit. (See Gr13E.)**
- **For the data writing and resetting work, consult your nearest authorized dealer or distributor.**

● **Installation sequence**

Follow the removal sequence in reverse.

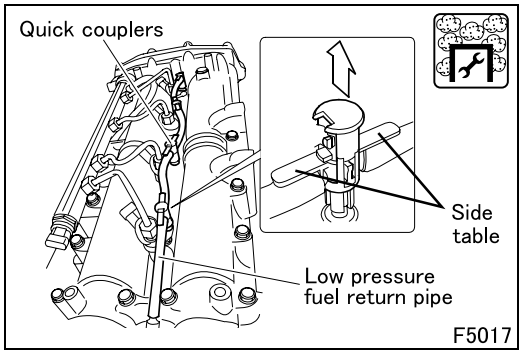
Ca	Head, flare nut wrench (width across flats: 18 mm {0.71 in.})  P110453	MH063983	Installation of fuel pipes
Cb	Socket wrench  P116185	MH064203	Removal and installation of fuel pipe <Four wheel drive>
Cc	Injector extractor  99340205	MH063990	Removal of injector

◆Removal procedure◆



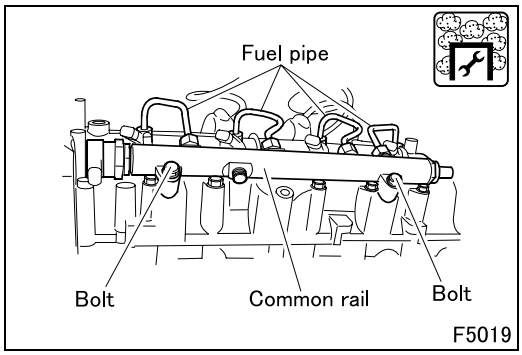
■ Removal: Low pressure fuel return pipe

: This work requires protection against dust.

- To remove the low pressure fuel return pipe from the injector, release the quick coupler.
- While holding down the side table of the quick coupler, pull up the central body as illustrated to remove the low pressure fuel return pipe.

https://truckmanualshub.com/

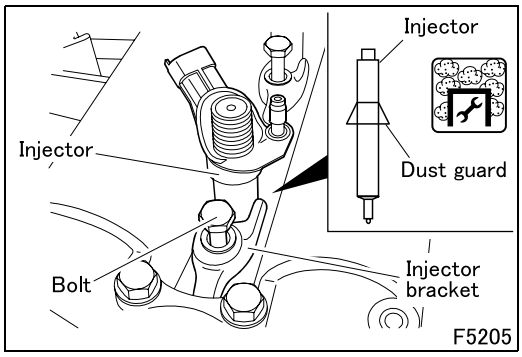
COMMON RAIL, INJECTOR



■ **Removal: Common rail, fuel pipe**

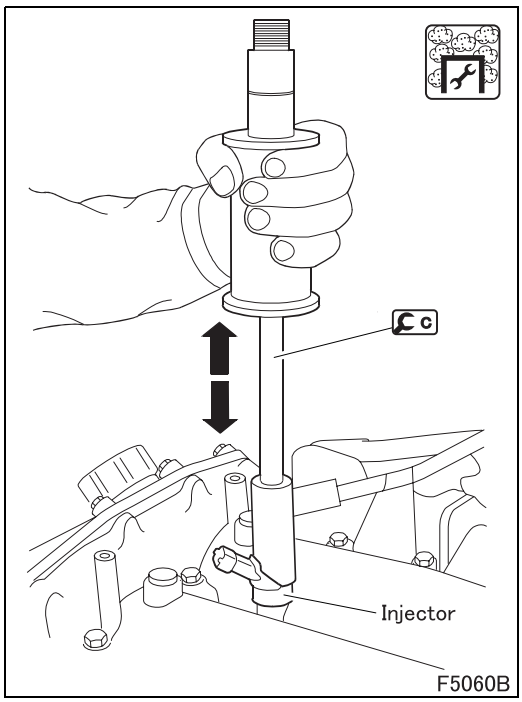
: This work requires protection against dust.

- Remove the injector side connectors using [b]. <Four wheel drive>
- Remove the common rail side connectors using [a].
- Unscrew and remove the bolts. Detach the common rail from the engine overhead.



■ **Removal: Injector bracket**

- Remove the injector bracket.



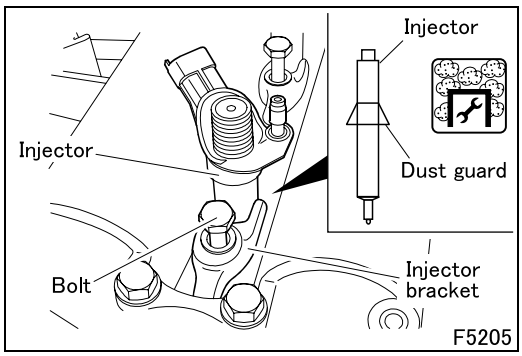
■ **Removal: Injector**

: This work requires protection against dust.

- Using [c], remove the injector from the engine overhead.

https://truckmanualshub.com/

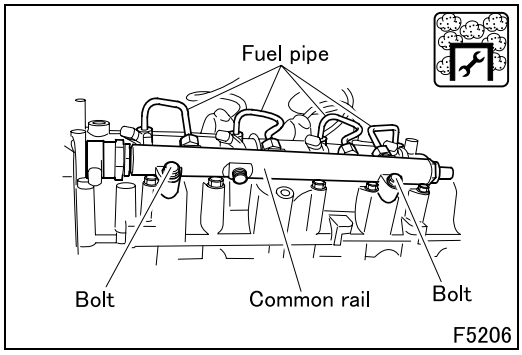
◆Installation procedure◆



■ Installation: Injector, injector bracket

: This work requires protection against dust.

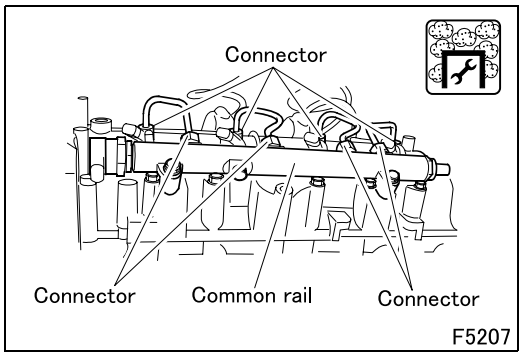
- Install a new dust guard on the injector.
- Install the injector on the engine overhead and loosely tighten the injector bracket bolt.
- After installing the fuel pipe and common rail, finally tighten the injector bracket bolt.



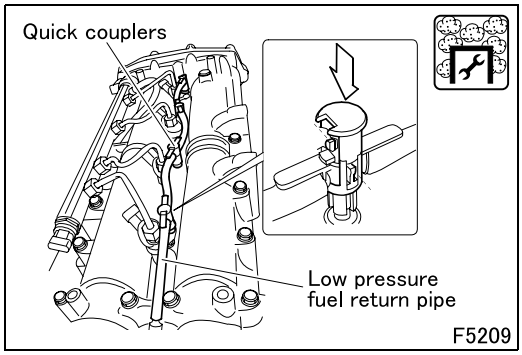
■ Installation: Common rail, fuel pipe

: This work requires protection against dust.

- Install the common rail on the engine overhead.
- Tighten the bolt to a torque of 28 N·m {21 ft.lbs, 2.8 kgf·m}.
- Connect the new fuel pipes to the injectors and to the common rail.



- Install the injector side connectors using [Cb]. <Four wheel drive>
  - Connector on the injector torque 25 ± 2 N·m {18.0 ± 1.5 ft.lbs, 2.5 ± 0.2 kgf·m}.
  - Install the common rail side connectors using [Ca].
  - Connector on the common rail torque 19 ± 2 N·m {14.0 ± 1.5 ft.lbs, 1.9 ± 0.2 kgf·m}.



■ Installation: Low pressure fuel return pipe

: This work requires protection against dust.

- Install the low pressure fuel return pipe.
- Lower the central body of the quick coupler by pushing it in the direction of the arrow.

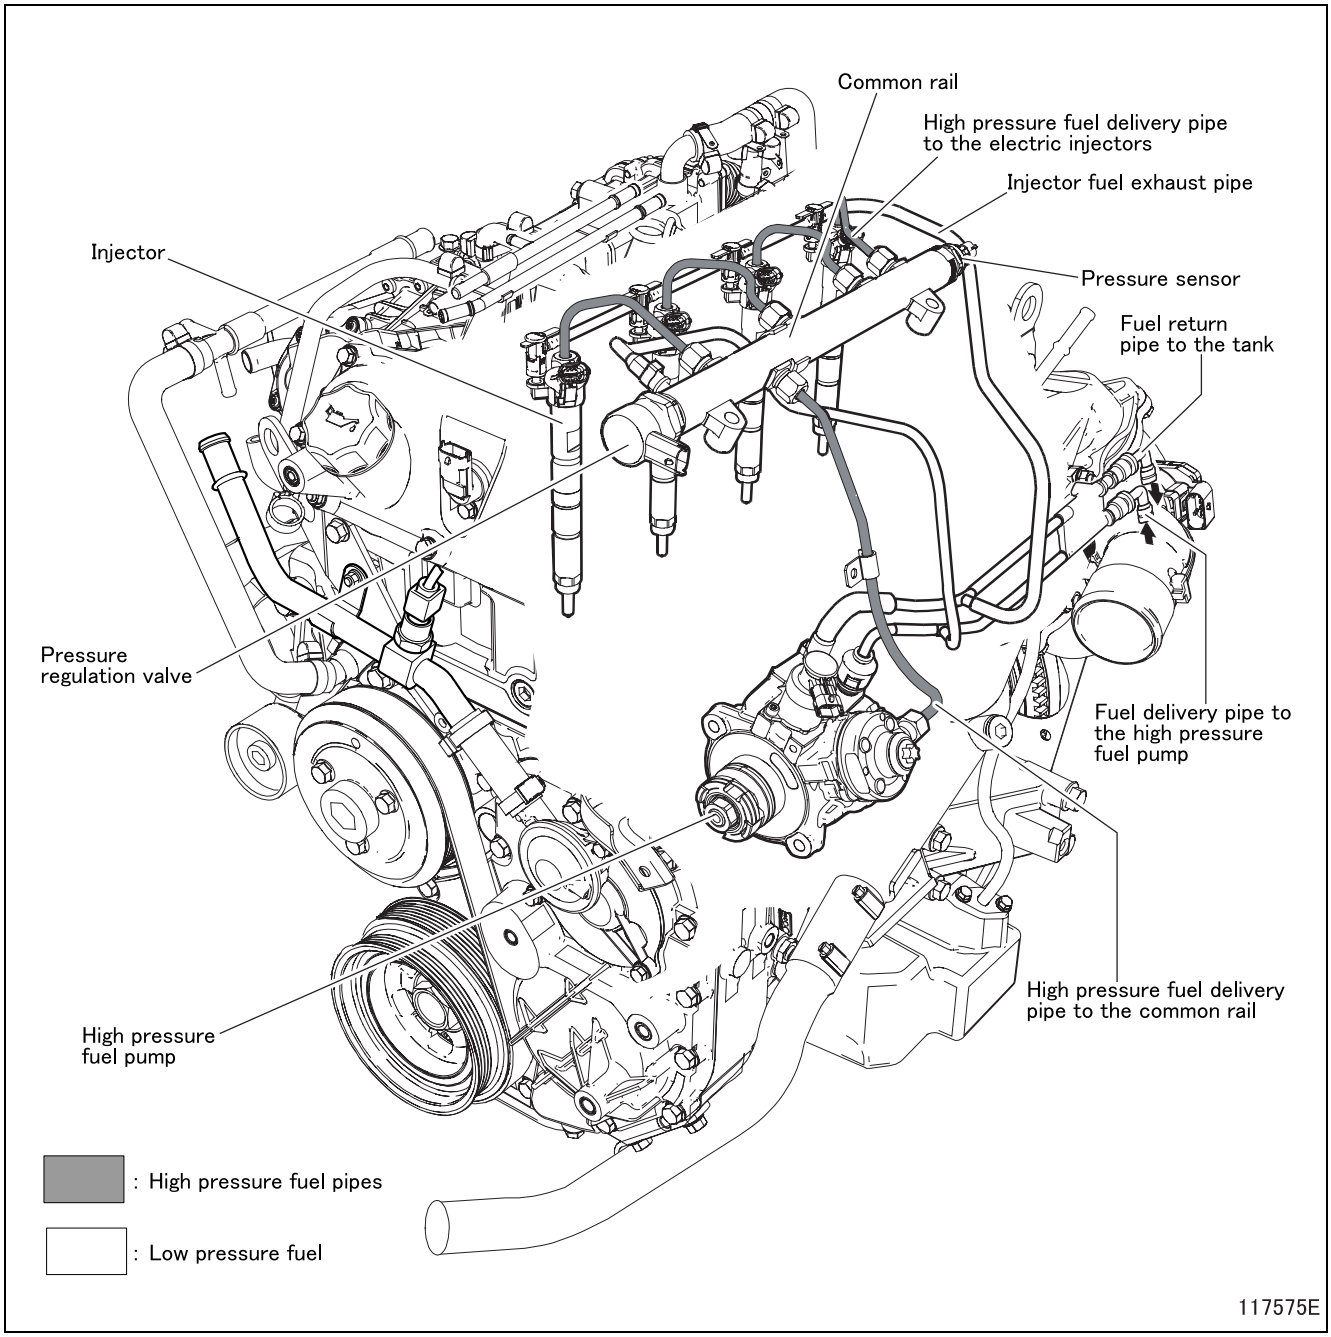
1. High Pressure Electronic Injection System

1.1 Over view

- The main characteristics of high pressure electronic injection system are:
  - High injection pressures available;
  - Pressures can be modulated irrespective of the speed of rotation and engine load;
  - Capacity to operate at very high speeds;
  - Injection control precision (injection duration and advance);
  - Lower consumption;
  - Lower emissions.



https://truckmanualshub.com/

- The main functions of the system are basically as follows:
  - Checking fuel temperature;
  - Checking engine coolant temperature;
  - Checking amount of fuel injected;
  - Checking idling speed;
  - Fuel cut-off when the accelerator pedal is released;
  - Checking cylinder balancing when idling;
  - Checking smokiness at exhaust on acceleration;
  - Checking exhaust gas recirculation (E.G.R.);
  - Checking top speed limit;
  - Checking glow plugs;
  - Checking activation of air-conditioning system (if any);
  - Checking auxiliary fuel pump;
  - Checking position of cylinders;
  - Checking main and pilot injection advance;
  - Checking closed cycle of injection pressure;
  - Checking turbocharging pressure;
  - Self-diagnosis;
  - Immobilizer electronic control unit;
  - Maximum torque limitation.

- The information the engine electronic control unit processes to regulate the amount of fuel to be injected comprises:
  - Engine speed;
  - Coolant temperature;
  - Turbocharging pressure;
  - Air temperature;
  - Intake air quantity;
  - Battery voltage;
  - Fuel pressure;
  - Position of throttle pedal.

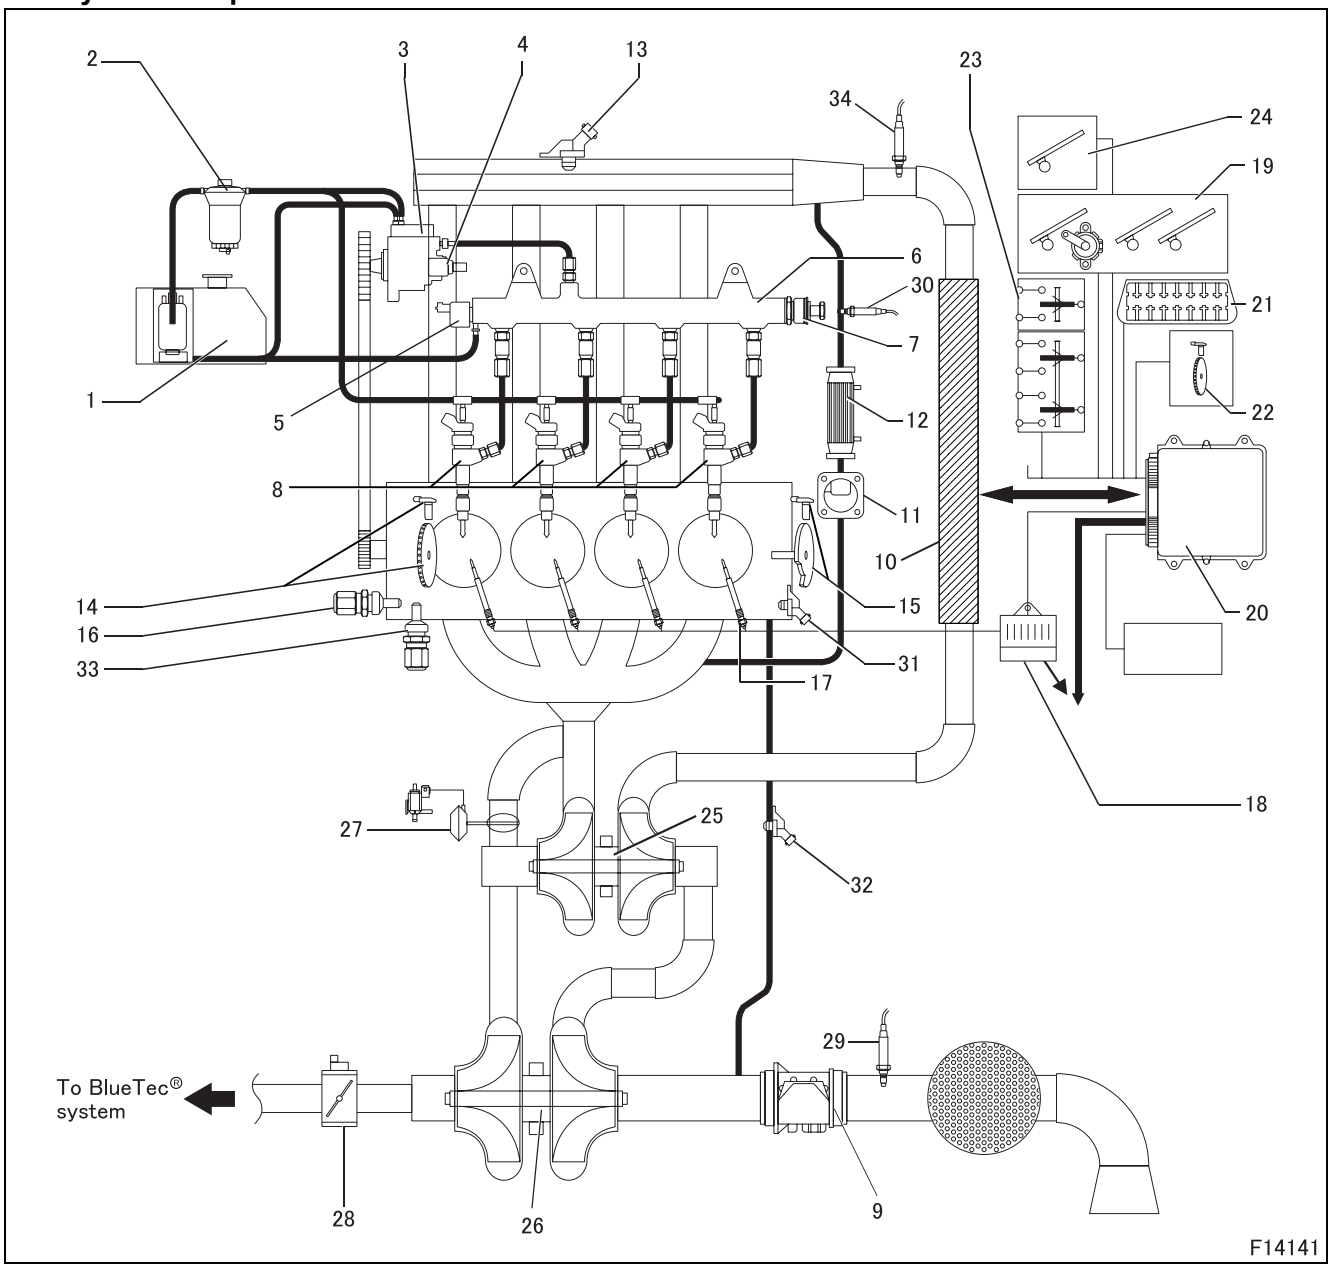
2. Engine Electronic Control System

2.1 System components



https://truckmanualshub.com/

No.	Parts name
1	Fuel tank with Fuel pump
2	Fuel filter (water separator sensor, fuel temperature sensor, fuel heater)
3	High pressure pump
4	FMU (fuel metering unit)
5	Pressure regulation valve
6	Common rail
7	Pressure sensor
8	Injectors
9	Air flow and intake air temperature sensor
10	Intercooler
11	EGR actuator
12	EGR cooler
13	Boost pressure and temperature sensor
14	Engine speed sensor
15	Camshaft timing sensor
16	Water temperature sensor
17	Glow plugs
18	Glow electronic control unit
19	Accelerator pedal
20	Engine electronic control unit
21	Diagnosis connector
22	Vehicle speed sensor
23	Transmission power take-off switch
24	Engine brake switch
25	High pressure turbocharger
26	Low pressure turbocharger
27	Turbo actuator
28	Exhaust brake valve
29	Humidity and intake air temperature sensor
30	EGR cooler outlet temperature sensor
31	Blow-by pressure sensor 1
32	Blow-by pressure sensor 2
33	Oil pressure switch
34	Intercooler outlet temperature sensor

2.2 Electronic injection system particular features of engines EPA 10

- To observe emission limits EPA 10, engines EPA 10 have following features:
  - E.G.R. system present;
  - D.P.F. filter (solid particulate trap with constant regeneration) present;
  - New digital flow meter HFM7 (positioned after the air filter);
  - Air pressure sensor present (on the intake manifold after the intercooler);
  - Fuel electrical pump suitable to pressurize the circuit according to specifications Euro V;
  - Vehicle wiring harness for central unit EDC 17 new electrical scheme;
  - Exhaust brake valve present driven by EDC central unit (positioned on exhaust line).
- Constant regeneration particulate trap is mounted on engine exhaust. Through data processing (engine rpm's, H_2O temperature, oil temperature, lambda probe signal, etc.), the central unit calculates the quantity of particulate accumulated in filter and chooses to increase exhaust gas temperature (through post-injection) in order to burn particulate accumulated inside filter.
- Further, vehicles (for compliance with regulations EPA 10) differ from the ones of present production mainly in following components:
  - Fitting with catalytic converter DPF (Diesel Particulate Filter) provided with exhaust gas temperature sensors,
  - Differential pressure (Delta-p) sensor for detecting DPF catalyst particulate filter clogging,
  - Fuel electric pump with different characteristics for boosting fuel system pressurization,
  - Electrical wiring harness.
  - SCR

2.3 Fuel injection control

- The system calculates injection on the basis of the processing of the following parameters:
  - Engine rpm.
  - Engine coolant fluid temperature.
  - Intake air capacity.
  - Battery voltage.
  - Fuel pressure.
  - Accelerator pedal position.

- The fuel pressure in the common rail varies according to engine rpm and load operating conditions.
- The pre-injection is carried out to reduce the noise level.
- Pre-injection advance angles, the distance between pre-injection and main injection and advance angles of main injection vary according to the instantaneous engine operating conditions.

(1) Immobilizer recognition

- When the control unit receives the signal of the key "ON" it communicates with the immobilizer control unit to enable starting.

(2) Checking engine coolant temperature

- The engine electronic control unit, depending on the temperature:
  - Of the engine coolant, turbocharging air and fuel, operates the viscous fan and switches on the coolant temperature warning light.

https://truckmanualshub.com/

(3) Checking quantity of fuel injected

- According to the signals from the sensors and the mapped values, the engine electronic control unit:
  - Operates the pressure regulation valve;
  - Varies the “pilot” injection time;
  - Varies the “main” injection time;
  - Checking idling adjustment

- The engine electronic control unit processes the signals from the various sensors and regulates the amount of fuel injected:
  - It operates the pressure regulator;
  - It varies the injection times of the injectors.

(4) Checking smokiness at exhaust on acceleration

- With heavy acceleration, on the basis of the signals received from the air introduction meter and engine speed sensor, the engine electronic control unit determines the optimum amount of fuel to inject:
  - It operates the pressure regulator;
  - It varies the injector injection time.

(5) Checking exhaust gas recirculation

- Depending on the engine load and the signal from the accelerator pedal sensor, the engine electronic control control unit limits the amount of air taken in, actuating partial suction of the exhaust gases.

(6) Checking engine rotation balance during acceleration

- Regular progression is assured in all conditions by the control of the pressure regulator and the injector opening time.

(7) Glow plug control

- During:
  - Preglow.
  - Afterglow.
  - The injection centre times the heater starter (or glow plugs for the 4P10 Engine) according to engine temperature.

(8) Checking fuel pump

- Irrespective of the speed, the engine electronic control unit:
  - Supplies the auxiliary fuel pump with the key “ON”;
  - Cuts off auxiliary pump supply if the engine is not started up within a few seconds.

(9) Checking fuel heater

- It times operation of fuel heater in relation to ambient temperature.

(10) Checking cylinder position

- During each turn of the engine, the engine electronic control unit recognizes which cylinder is in the power stroke and operates the injection sequence for the appropriate cylinder.

(11) Checking pilot and main injection timing

- According to the signals from the various sensors, including the absolute pressure sensor built into the engine electronic control unit, the engine electronic control unit determines the optimum point of injection according to internal mapping.

https://truckmanualshub.com/

(12) Checking injection pressure closed cycle

- Depending on the engine load, determined by processing the signals from the various sensors, the engine electronic control unit operates the regulator to obtain optimum line pressure.

(13) Fuel supply

- The fuel supply is calculated in relation to:
  - Accelerator pedal position.
  - Engine speed.
  - Quantity of air introduced.
- The outcome may be corrected in relation to:
  - The water temperature.
- Or to avoid:
  - Noise.
  - Smoke.
  - Overloading.
  - Overheating.
  - Turbine over-revving.
- The delivery can be modified in the case of:
  - Action of external devices (ABS).
  - Serious trouble decreasing the load or stopping the engine.

- After determining the mass of air introduced by measuring its volume and temperature, the engine electronic control unit calculates the corresponding mass of fuel to inject into the relevant cylinder (mg per delivery) also taking into account the temperature of the diesel.
- The mass of fuel calculated in this way is first converted into volume (mm^3 per delivery) and then into degrees of throw, or duration of injection.

(14) Correcting flow rate according to water temperature

- A cold engine meets with greater resistance during operation: friction is high, the oil is still very viscous, and the various clearances are not yet optimized.
- In addition, the injected fuel tends to condense on the metal surfaces that are still cold.
  The fuel supply for a cold engine is therefore greater than for a warm one.

(15) De-rating

- In the event of the engine overheating, injection is modified, decreasing the delivery to a varying degree, in proportion to the temperature reached by the coolant.

(16) Turbine rpm setting

- Based on signals from the accelerator pedal position and intake manifold air temperature/pressure engine rpm sensors, the electronic centre processes the field-back signal to turbo actuator pilot electro valve opening.

(17) Injection timing electronic test

- The advance (start of delivery, expressed in degrees) may be different from one injection to the next, also differentiated from one cylinder to another. It is calculated, similarly to the delivery, in relation to the engine load (accelerator position, engine speed and air introduced).
- The advance is appropriately corrected:
  - In phases of acceleration;
  - According to the water temperature.
- And also to obtain:
  - Lower emissions, noise and overloading;
  - Better vehicle acceleration.
- An extremely high advance is set on starting, depending on the water temperature.
- Feedback from the start of delivery is supplied by the change in impedance of the injector solenoid valve.

https://truckmanualshub.com/

(18) Speed governor

- The electronic speed governor has both features of governors:
  - Idling and top speed.
  - All speeds.
- It is stable in ranges where conventional, mechanical governors are imprecise.
- Within certain thresholds the speed takes account of the battery voltage.

(19) Engine starting

- During the first few turns of the engine, the timing and cylinder no. 1 recognition signals (engine speed sensor and camshaft timing sensor) are synchronized.
- The accelerator pedal signal is ignored on starting. Starting delivery is set only according to water temperature, by a special map.

(20) Cold starting

- If even just one of the three temperature sensors (water, air or diesel) records a temperature lower than 10°C {50 °F}, the glow plugs are activated.
- On inserting the key contact, the glow plug indicator goes on and remains on for a period varying depending on temperature (air is heated by the pre-heating glow plugs that are located on cylinder head).
- Thereafter, the engine can be started up.
- When the motor is running this indicator light goes out, while the glow plugs continue to be powered for a certain length of time (variable) for post-heating.
- The pre-heating curve is also variable in relation to the battery voltage.

(21) Run up

- When the key makes contact, the engine electronic control unit transfers the information stored in memory when the engine was last stopped into the main memory (see After Run) and makes a diagnosis of the system.

(22) After run

- Whenever the engine is switched off with the key, the engine electronic control unit stays powered for about 30 seconds by the main relay.
- This makes it possible for the microprocessor to transfer some data from the main memory (volatile) to a non-volatile memory, which can be erased and written over (EEPROM), so as to make it available at the next start up (see Run Up).
- These data basically consist of:
  - Various settings (engine idling adjustment, etc.);
  - Settings of some components;
  - Fault memory.
- The process lasts a few seconds, typically from about 30 (depending on the amount of data to save), after which the engine electronic control unit sends a command to the main relay and makes it disconnect from the battery.

NOTE

- **It is extremely important for this procedure not to be broken off, for example by switching off the engine with the battery cut-out, or by disconnecting the battery cut-out before 20 seconds have passed since switching off the engine. If this happens, the functioning of the system is ensured, but repeated interruptions may damage the engine electronic control unit.**

(23) Cut-off

- This function cuts off fuel delivery when the vehicle is decelerating (accelerator pedal released).

(24) Cylinder balancing

- Individual cylinder balancing contributes to increasing comfort and handling.
- This function permits individual, customized control over the delivery of fuel and the start of delivery for each cylinder, even differently from one cylinder to another, to compensate for the hydraulic tolerances of the injector.

https://truckmanualshub.com/

- The differences in flow (delivery specifications) between the various injectors cannot be evaluated directly by the engine electronic control unit. Therefore, it is necessary to input particular data of each injector into the engine electronic control unit using FUSO diagnostics each time after injector replacement.

(25) Synchronisation search

- If there is no signal from the camshaft timing sensor, the engine electronic control unit is able to recognize the cylinders into which the fuel is to be injected.
- If this occurs when the engine is already running, the combustion sequence has already been acquired, so the engine electronic control unit continues with the sequence on which it has already been synchronized.
- If this occurs when the engine is at a standstill, the engine electronic control unit energizes a single solenoid valve. Within 2 turns of the crankshaft, injection will take place in that cylinder, so the engine electronic control unit just needs to get synchronized on the firing sequence and to start up the engine.

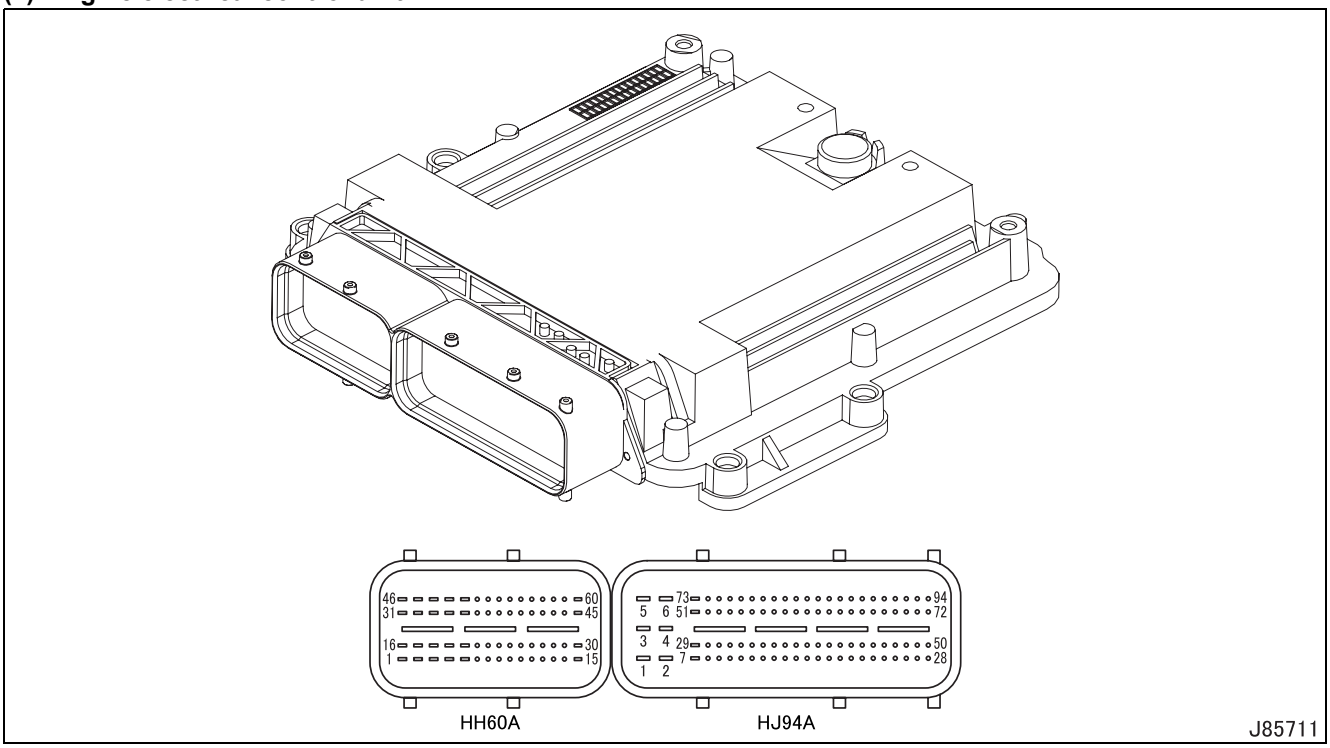
2.4 Actuators

- The injection system comprises three classes of actuators interlocked with the engine electronic control unit:
  - Injectors (see relevant heading);
  - Regulators (see relevant headings) requiring PWM control (Pulse Width Modulation):
    - For pressure;
    - EGR (Exhaust Gas Recirculation);
  - Actuators with continuous ON/OFF signal to:
    - Turn on/off air-conditioner compressor;
    - Electric supply pump.
    - Cruise control.

https://truckmanualshub.com/

2.5 Electric/electronic components

(1) Engine electrical control unit



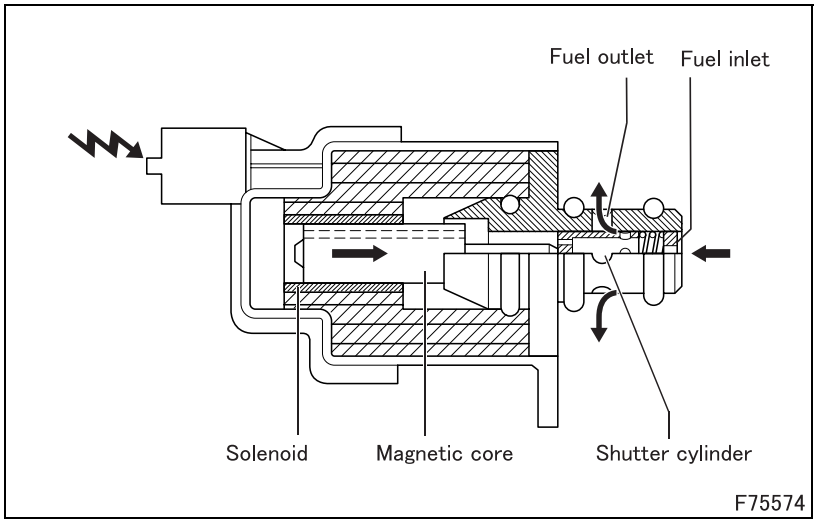
- The engine electronic control unit is of the “flash EPROM” type, i.e. it can be reprogrammed from the outside without acting on its hardware.
- The engine electronic control unit processes the signals from the sensors by applying software algorithms, and also controls the actuators (in particular, the electric injectors and the pressure regulator).
- The engine electronic control unit records, in the memory non-labile area, the information on the engine parameters originally set or acquired during engine operation.
- The injection control unit incorporates the atmospheric sensor, in order to further improve the injection system control.
- The engine electronic control unit is fitted to the left side of the engine compartment and is connected to the vehicle wiring by means of two connectors:
  - 60-pole connector “Engine side injection cable connector” for the components available on the engine;
  - 94-pole connector “Bonnet/cab cable connector” for the components on the vehicle.
- In addition to controlling the system functions described in the respective charter, the engine electronic control unit is interfaced with the other electronic systems found on the vehicle, such as ABS (Anti-lock Brake System), speed limiter, EGR (Exhaust Gas Recirculation), preheating plugs.
- On the vehicles equipped with DPF (Diesel Particulate Filter), the engine electronic control unit also controls the DPF regeneration system. In this case, after any of the operations below is carried out:
  - Replacing one or several injectors,
  - Replacing all the injectors,

  The engine electronic control unit shall be programmed again by means of the FUSO Diagnostics, and the replacement procedure for the concerned component shall be performed, in accordance with the indications of the diagnosis instruments.

https://truckmanualshub.com/

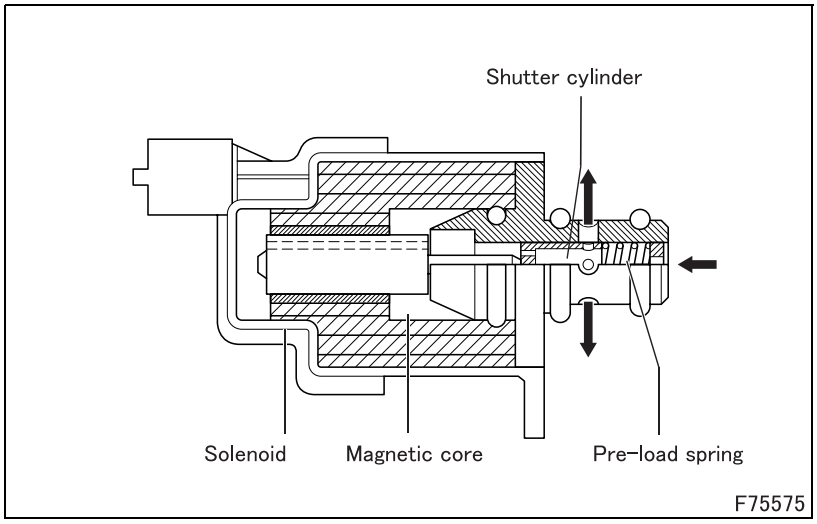
(2) FMU (fuel metering unit)

- The FMU (fuel metering unit) is mounted on the low-pressure circuit of the high pressure pump. The pressure regulator modulates the amount of fuel sent to the high-pressure circuit according to the commands received directly from the engine electronic control unit. The pressure regulator is mainly composed of the following components:
  - Connector.
  - Casing.
  - Solenoid.
  - Pre-load spring.
  - Hutter cylinder.
- When there is no signal, the pressure regulator is normally open, therefore with the pump providing maximum delivery.
- The engine electronic control unit, via the PWM (Pulse Width Modulation) signal, modulates the change in fuel flow rate in the high-pressure circuit by partially closing or opening the sections of passage of the fuel in the low-pressure circuit.



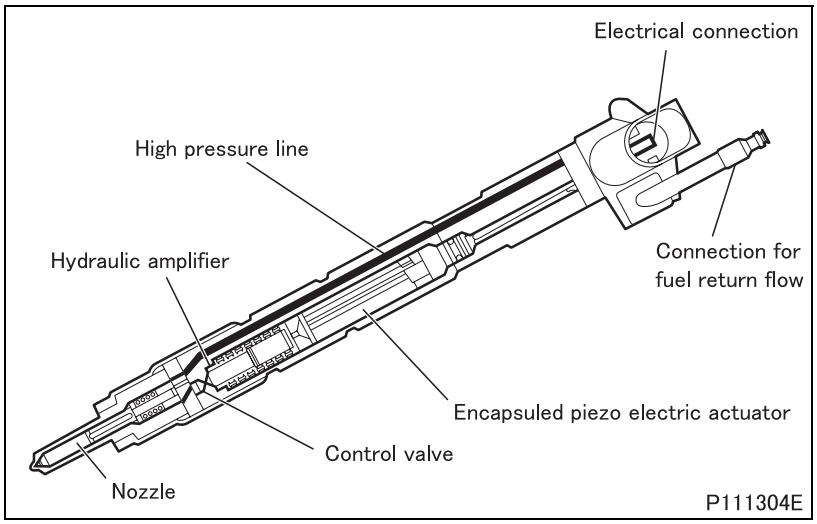
(2.1) Operation

- When the engine electronic control unit governs the FMU (fuel metering unit) (via PWM signal), the solenoid is energized that, in its turn, generates the movement of the magnetic core. The shift of the core causes the shutter cylinder to move axially, reducing the flow of fuel.



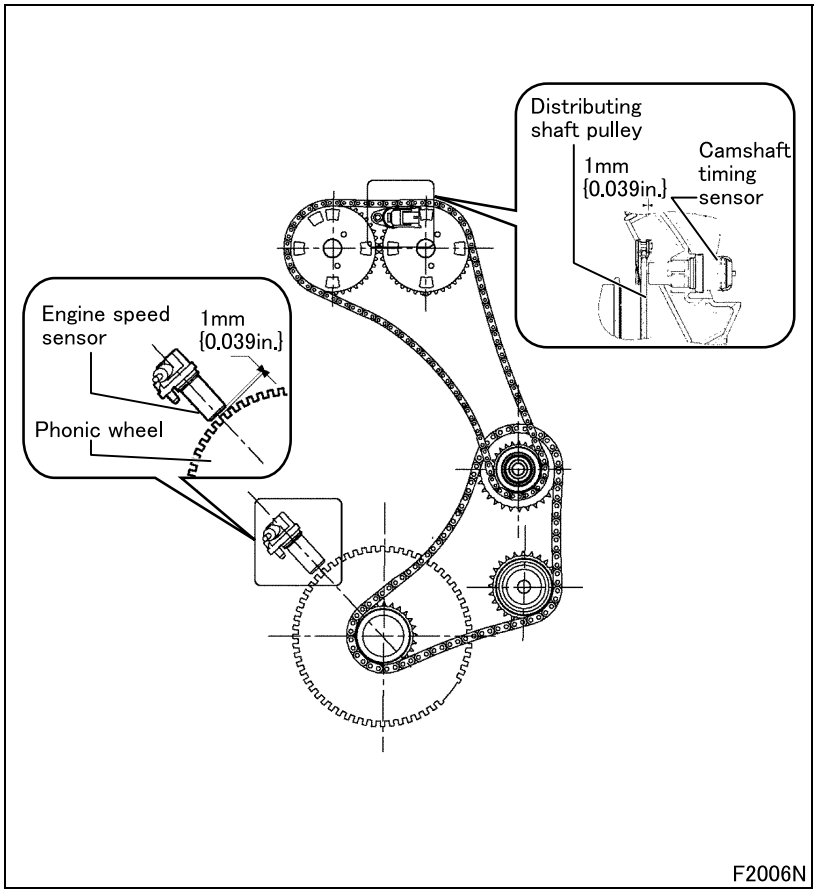
- When the solenoid is not energized, the magnetic core is pushed into the rest position by the pre-load spring. In this condition, the shutter cylinder is in such a position as to offer the fuel the maximum flow and pressure.

https://truckmanualshub.com/



(3) Injector

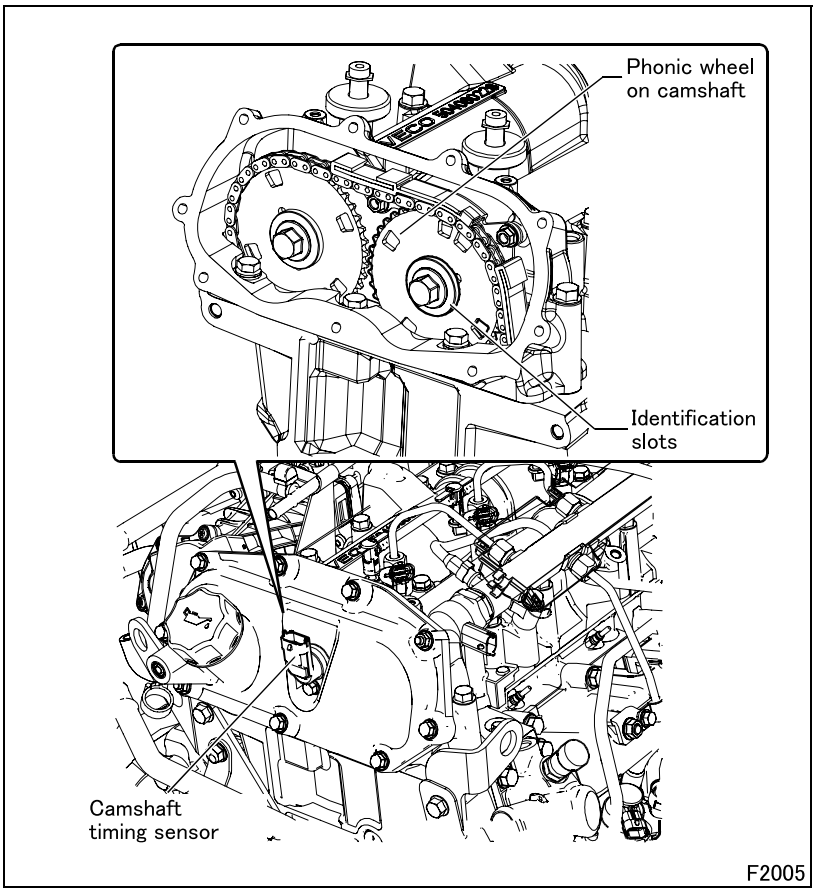
- When the piezoelectric actuator is reached by an electrical load, commanded by the engine electronic control unit, it increases its length. The movement, amplified by the hydraulic amplifier, act mechanically on the control valve and it allows therefore the injection of the fuel present in the high pressure line. While stopping the electrical load, the actuator reacts elastically and again assumes its initial length.The springs add their contribution, winning the pressures that act in balancing on the whole surface of the components. The fuel in excess is than recirculated in the fuel circuit through the connection for fuel return flow.



(4) Engine speed sensor

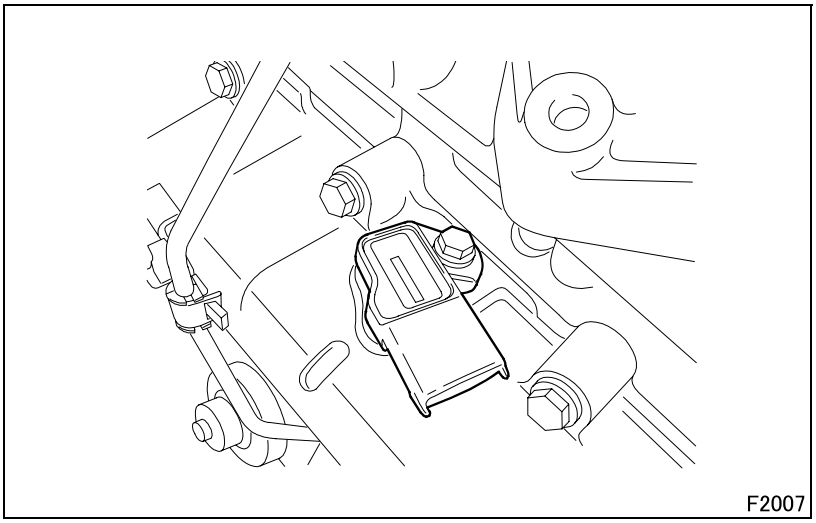
- It is an inductive sensor and is positioned on the phonic wheel fitted on the front end of the drive shaft.
- It generates the signals resulting from the magnetic flow lines which close through the teeth of the phonic wheel.
- The engine electronic control unit uses this signal to measure the speed of rotation of the engine, its angular position and to operate the electronic RPM counter.
- If this signal fails the RPM counter will not work.
- The sensor gap shall be as follows:
  - 1 ± 0.5 mm {0.039 ± 0.020 in.}, between distributing shaft pulley and phase sensor,
  - 1 mm {0.039 in.}, between phonic wheel and engine speed sensor.

https://truckmanualshub.com/



(5) Camshaft timing sensor

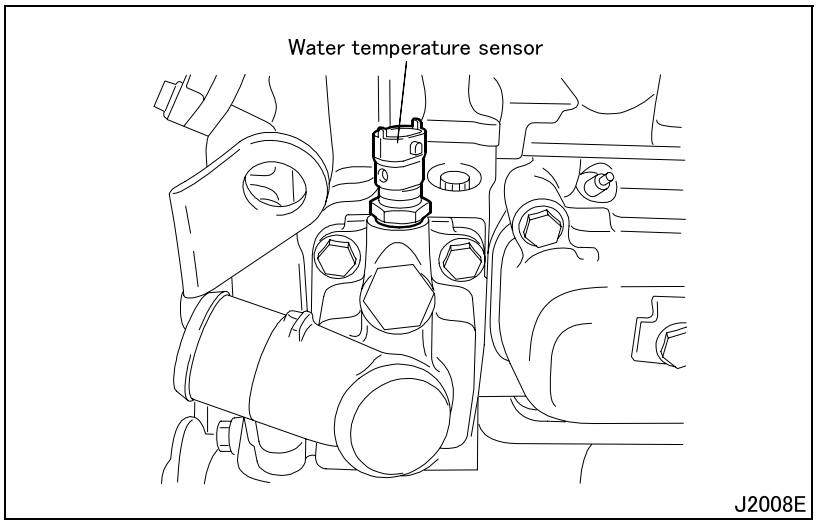
- It is an inductive sensor and is positioned on the camshaft gear of the suction valves.
- It generates the signals resulting from the magnetic flow lines which close through a slot on the gear itself.
- The signal generated by this sensor is used by the engine electronic control unit as a redundant signal to measure the different engine speeds.



(6) Boost pressure and temperature sensor

- Positioned on the intake manifold, it measures the pressure of the turbocharging air introduced into the intake manifold.
- This value, together with that of the boost pressure and temperature sensor, makes it possible for the engine electronic control unit to calculate the exact quantity of air introduced into the cylinders so as to operate the injectors adjusting the fuel delivery, limiting harmful emissions, improving consumption and performance.
- The sensor contains an electronic temperature correction circuit to optimize the pressure measurement in relation to the temperature of the intake air.

https://truckmanualshub.com/



(7) Water temperature sensor

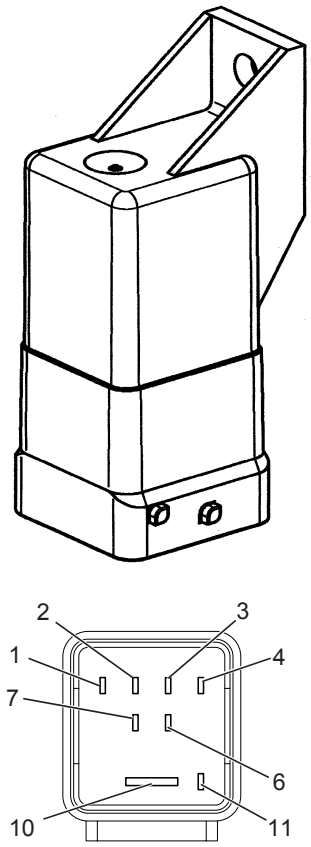
- When temperature sensor for engine control provides the engine electronic control unit with an index of the thermal status of the engine in order to determine corrections for the fuel delivery, injection pressure, exhaust gas recirculation injection advance when starting cold (if mounted) and warm-up.

(8) Atmospheric pressure sensor

- This is integrated in the engine electronic control unit. It provides a criterion of correction for the measurement of the air flow rate and to calculate the reference air flow rate to check the EGR.

https://truckmanualshub.com/

(9) Glow plug electronic control unit

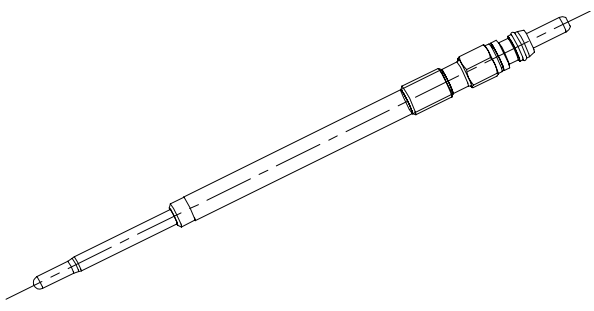


1	Connections glow plugs
2	Connections glow plugs
3	Connections glow plugs
4	Connections glow plugs
6	Ground
7	Start switch (+15)
10	Battery positive (+30)
11	Input: control signal from engine electronic control unit

13105E

- The glow electronic control unit is controlled by engine electronic control unit and has following functions:
  - Switch of 4 glow plugs, control signal from engine electronic control unit;
  - Reversible overcurrent cut-off (electronic safety fuse);
  - Recognition of one or several damaged glow plugs and overall defect diagnosis;
  - High voltage switch - off by engine electronic control unit;

(10) Glow plug



F2009

[CONTROL VALUES]

- With a constant supply voltage of 11 V:
  - Max. current drawn: 18 A.
  - In 5 sec: 11 ± 1.5 A.
  - In 30 sec: 6 ± 0.9 A.
  - Temperature after 7 sec.: 850°C. {1562°F}

1.2 Details of Diagnosis code

22-0: Signal Range Check (SRC) for 'Pressure sensor in crankcase' reports HIGH.

Generation condition		[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The acquired raw voltage value CrCsP2_uRaw is above 3.17V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• The acquired raw voltage value CrCsP2_uRaw is below or equal to 3.17V.
System reaction		• Crankcase differential pressure is frozen at last valid value on preliminary failure and ramps, using slope 5kPa {0.7psi, 0.05kgf/cm^2}/s or 5kPa {0.7psi, 0.05kgf/cm^2}/s depending whether the measured value is above or below replacement value, to a fixed replacement value of 0kPa {0psi, 0kgf/cm^2} • Further reactions according FID (see FID's)
		• 1) FId / Freeze value of crankcase pressure 2 in case of error • 2) FId / Inhibit offset calculation for crankcase pressure 2 • 3) FId / Set replace value for crankcase pressure 2 when error is detected • 4) FId / Inhibit physical range check for crankcase pressure 2 • 5) FId / Inhibit crankcase ventilation monitoring
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring and sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B58 (Blow-by gas pressure sensor 1). Check the circuit across B58.3/3 and A4.X1.60/9 for open or short circuit. Check the circuit across B58.3/2 and A4.X1.60/28 for open or short circuit. Check the circuit across B58.3/1 and A4.X1.60/59 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B58 (Blow-by gas pressure sensor 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

22-1: Signal Range Check (SRC) for 'Pressure sensor in crankcase' reports LOW.

Generation condition		[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The acquired raw voltage value CrCsP2_uRaw is below 640.00mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• The acquired raw voltage value CrCsP2_uRaw is above or equal to 640.00mV
System reaction		• Crankcase differential pressure is frozen at last valid value on preliminary failure and ramps, using slope 5kPa {0.7psi, 0.05kgf/cm^2}/s or 5kPa {0.7psi, 0.05kgf/cm^2}/s depending whether the measured value is above or below replacement value, to a fixed replacement value of 0kPa {0psi, 0kgf/cm^2} • Further reactions according FID (see FID's)
		• 1) FId / Freeze value of crankcase pressure 2 in case of error • 2) FId / Inhibit offset calculation for crankcase pressure 2 • 3) FId / Set replace value for crankcase pressure 2 when error is detected • 4) FId / Inhibit physical range check for crankcase pressure 2 • 5) FId / Inhibit crankcase ventilation monitoring
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B58 (Blow-by gas pressure sensor 1). Check the circuit across B58.3/3 and A4.X1.60/9 for open or short circuit. Check the circuit across B58.3/2 and A4.X1.60/28 for open or short circuit. Check the circuit across B58.3/1 and A4.X1.60/59 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B58 (Blow-by gas pressure sensor 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

22-16: The signal value of component 'Pressure sensor in crankcase' is too high.

Generation condition		[Test Condition] • If physical range check not inhibited by another failure (DINH_stFld.Fld_CrCsP2PhysRng is not inhibited)
		[Fault Detection] • The filtered pressure value CrCsP2_p is above 10kPa {1.5psi, 0.1kgf/cm^2}.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 25% of the time
Fault healing		• The filtered pressure value CrCsP2_p is below 10kPa {1.5psi, 0.1kgf/cm^2}.
System reaction		• None (only via inhibit handler)
		• 1) Fld / Inhibit offset calculation for crankcase pressure 2 • 2) Fld / Inhibit crankcase ventilation monitoring
Failure cause		• Inaccurate or defective crankcase differential pressure sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the crankcase differential pressure sensor and replace it if necessary
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B58 (Blow-by gas pressure sensor 1). Check the circuit across B58.3/3 and A4.X1.60/9 for open or short circuit. Check the circuit across B58.3/2 and A4.X1.60/28 for open or short circuit. Check the circuit across B58.3/1 and A4.X1.60/59 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B58 (Blow-by gas pressure sensor 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

22-18: The signal value of component 'Pressure sensor in crankcase' is too low.

Generation condition		[Test Condition] • If physical range check not inhibited by another failure (DINH_stFId.FId_CrCsP2PhysRng is not inhibited)
		[Fault Detection] • The filtered raw pressure value CrCsP2_p is below -2.1kPa {-0.3psi, -0.02kgf/cm^2}
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 25% of the time
Fault healing		• The filtered raw pressure value CrCsP2_p is above -2.1kPa {-0.3psi, -0.02kgf/cm^2}
System reaction		• None (only via inhibit handler)
		• 1) FId / Inhibit offset calculation for crankcase pressure 2 • 2) FId / Inhibit crankcase ventilation monitoring
Failure cause		• Inaccurate or defective crankcase differential pressure sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the crankcase differential pressure sensor and replace it if necessary. • Check also vacuum pump (vacuum breaker).
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B58 (Blow-by gas pressure sensor 1). Check the circuit across B58.3/3 and A4.X1.60/9 for open or short circuit. Check the circuit across B58.3/2 and A4.X1.60/28 for open or short circuit. Check the circuit across B58.3/1 and A4.X1.60/59 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B58 (Blow-by gas pressure sensor 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

27-15: EGR valve is too high. Position deviation above maximum positive limit.

Generation condition		[Test Condition] • Continuously if monitoring is not disabled by FID_EGRVlvGovOn due to another failure (valve control in closed loop).
		[Fault Detection] • EGR valve position deviation > 10.00% (i.e. too high EGR flow) for a time longer than time from curve EGRVlv_tiDebGovDvtDef depending from governor position
		[Defect Debouncing] • Immediate
Fault healing		• EGR valve position deviation < 10.00%
System reaction		• Additional Release function becomes active a fast opening actuator is performed to try to unblock the actuator. • Further reactions according FID (see FID's)
		• 1) FId / Inhibit crankcase ventilation monitoring • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Inhibit EGR cooler efficiency monitoring • 4) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 5) FID / Drift compensation of Air flow meter (HFM/AFS) disabled
Failure cause		• Desired EGR valve position can not be reached • EGR valve sticks • EGR valve position sensor mismatched
Failure repair		• No action needed, as long as failure "jammed valve is not detected"
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control "Control of exhaust gas recirculation". Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

27-17: EGR valve is too low. Position deviation below maximum negative limit.

Generation condition		[Test Condition] • Continuously if monitoring is not disabled by FID_EGRVlvGovOn due to another failure (valve control in closed loop).
		[Fault Detection] • EGR valve position deviation < -10.00% (i.e. too low EGR flow) for a time longer than time from curve 4.00s at 0.00% depending from governor position
		[Defect Debouncing] • Immediate
Fault healing		• EGR valve position deviation > -10.00%
System reaction		• Additional Release function becomes active a fast opening actuator is performed to try to unblock the actuator. • Further reactions according FID (see FID’s)
		• 1) FId / Inhibit crankcase ventilation monitoring • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Inhibit EGR cooler efficiency monitoring • 4) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 5) FID / Drift compensation of Air flow meter (HFM/AFS) disabled
Failure cause		• Desired EGR valve position can not be reached • EGR valve sticks • EGR valve position sensor mismatched
Failure repair		• No action needed, as long as failure “jammed valve is not detected”
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

30-0: Signal Range Check (SRC) for ‘Pressure sensor in hose line of crankcase ventilation system’ reports HIGH.

Generation condition	[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • The acquired raw voltage value CrCsP_uRaw is above 4.75V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing	• The acquired raw voltage value CrCsP_uRaw is below 4.75V

https://truckmanualshub.com/

System reaction		• Crankcase differential pressure is frozen at last valid value on preliminary failure and ramps, using slope 5kPa {0.7psi, 0.05kgf/cm^2}/s or 5kPa {0.7psi, 0.05kgf/cm^2}/s depending whether the measured value is above or below replacement value, to a fixed replacement value of 0kPa {0psi, 0kgf/cm^2} • Further reactions according FID (see FID's)
		• 1) FId / Crankcase pressure value frozen • 2) FId / Inhibit crankcase pressure offset calculation • 3) FId / Crankcase pressure value replaced by substitute value • 4) FId / Inhibit crankcase ventilation monitoring • 5) FId / Inhibit SRC of crankcase pressure
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring and sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B59 (Blow-by gas pressure sensor 2). Check the circuit across B59.3/3 and A4.X1.60/58 for open or short circuit. Check the circuit across B59.3/2 and A4.X1.60/26 for open or short circuit. Check the circuit across B59.3/1 and A4.X1.60/4 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B59 (Blow-by gas pressure sensor 2)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

30-1: Signal Range Check (SRC) for 'Pressure sensor in hose line of crankcase ventilation system' reports LOW.

Generation condition		[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The acquired raw voltage value CrCsP_uRaw is below 250.00mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• The acquired raw voltage value CrCsP_uRaw is above 250.00mV.
System reaction		• Crankcase differential pressure is frozen at last valid value on preliminary failure and ramps, using slope 5kPa {0.7psi, 0.05kgf/cm^2}/s or 5kPa {0.7psi, 0.05kgf/cm^2}/s depending whether the measured value is above or below replacement value, to a fixed replacement value of 0kPa {0psi, 0kgf/cm^2} • Further reactions according FID (see FID's)
		• 1) FId / Crankcase pressure value frozen • 2) FId / Inhibit crankcase pressure offset calculation • 3) FId / Crankcase pressure value replaced by substitute value • 4) FId / Inhibit crankcase ventilation monitoring • 5) FId / Inhibit SRC of crankcase pressure
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B59 (Blow-by gas pressure sensor 2). Check the circuit across B59.3/3 and A4.X1.60/58 for open or short circuit. Check the circuit across B59.3/2 and A4.X1.60/26 for open or short circuit. Check the circuit across B59.3/1 and A4.X1.60/4 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B59 (Blow-by gas pressure sensor 2)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

30-2: The value of component 'B37 (DPF differential pressure sensor)' is implausible. Value measured at ECM shut off.

Generation condition		[Test Condition] • During ECM after-run when engine is stopped
		[Fault Detection] • The absolute value of Crankcase pressure CrCsP_p is above 1.9kPa {0.3psi, 0.02kgf/cm^2}
		[Defect Debouncing] • Immediate
Fault healing		• The absolute value of Crankcase pressure CrCsP_p is below 1.9kPa {0.3psi, 0.02kgf/cm^2}.
System reaction		• None (only via Inhibit Handler)
		• 1) FId / Inhibit SRC of crankcase pressure • 2) FId / Inhibit crankcase ventilation monitoring
Failure cause		• Inaccurate or defective crankcase differential pressure sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the crankcase differential pressure sensor and replace it if necessary
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B58 (Blow-by gas pressure sensor 1). Check the circuit across B58.3/3 and A4.X1.60/9 for open or short circuit. Check the circuit across B58.3/2 and A4.X1.60/28 for open or short circuit. Check the circuit across B58.3/1 and A4.X1.60/59 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B58 (Blow-by gas pressure sensor 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

30-15: The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.

Generation condition		[Test Condition] • If monitor not inhibited by another failure (FId_CrCsVMon not set) • Engine speed between 2000.00rpm and 3400.00rpm • Air mass between 300.00Kg/h and 600.00Kg/h • atmospheric pressure EnvP_p > 75kPa {11psi, 0.8kgf/cm^2}, low altitude • environmental temperature CrCsV_tAirEnv_mp > -40.04°C {-40.07°F} • coolant temperature CEngDsT_t between 59.96°C {139.93°F} and 119.96°C {247.93°F}
		[Fault Detection] • The differential crankcase pressure exceeds a limit depending on engine running parameters defined in map CrCsV_pDiffCrCsThres, for longer than 10.00s
		[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing		• The differential crankcase pressure is below limit, for longer than 500.00ms
System reaction		• None
		• Disconnection in hose line between the crankcase and intake manifold
Failure cause		• Check blow-by duct
Failure repair		[Test Condition] • If monitor not inhibited by another failure (FId_CrCsVMon not set) • Engine speed between 2000.00rpm and 3400.00rpm • Air mass between 300.00Kg/h and 600.00Kg/h • atmospheric pressure EnvP_p > 75kPa {11psi, 0.8kgf/cm^2}, low altitude • environmental temperature CrCsV_tAirEnv_mp > -40.04°C {-40.07°F} • coolant temperature CEngDsT_t between 59.96°C {139.93°F} and 119.96°C {247.93°F}
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

30-16: The signal value of component 'Pressure sensor in hose line of crankcase ventilation system' is too high.

Generation condition	[Test Condition] • If physical range check not inhibited by another failure (Fid_CrCsPPhysRng not set)
	[Fault Detection] • The filtered pressure value CrCsP_p is above 1.9kPa {0.3psi, 0.02kgf/cm^2}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 25% of the time
Fault healing	• The filtered pressure value CrCsP_p is below 1.9kPa {0.3psi, 0.02kgf/cm^2}.
System reaction	• None except FIds
	• 1) FId / Inhibit crankcase ventilation monitoring • 2) FId / Inhibit crankcase pressure offset calculation
Failure cause	• Inaccurate or defective crankcase differential pressure sensor, defect in the wiring
Failure repair	• Check wiring and the accuracy of the crankcase differential pressure sensor and replace it if necessary

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B59 (Blow-by gas pressure sensor 2). Check the circuit across B59.3/3 and A4.X1.60/58 for open or short circuit. Check the circuit across B59.3/2 and A4.X1.60/26 for open or short circuit. Check the circuit across B59.3/1 and A4.X1.60/4 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B59 (Blow-by gas pressure sensor 2)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

30-17: The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.: TOO HIGH

Generation condition	[Test Condition] • If monitor not inhibited by another failure (FId_CrCsVMon not set) • engine speed is between 2000.00rpm and 3400.00rpm • atmospheric pressure EnvP_p > 75kPa {11psi, 0.8kgf/cm^2}, low altitude • environmental temperature CrCsV_tAirEnv_mp > -40.04°C {-40.07°F} • engine coolant temperature CEngDsT_t is between 59.96°C {139.93°F} and 119.96°C {247.93°F} • The current actual torque ActMod_trqInr is between 100N·m {74lbs.ft, 10kgf·m} and 450N·m {330lbs.ft, 46kgf·m}
	[Fault Detection] • Differential crankcase pressure CrCsP_p is above reference value CrCsV_pDiffCrCsThres2_mp resulting from CrCsV_pDiffCrCsThres2_MAP, for at least 10.00s.
	[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing	• Differential crankcase pressure in range
System reaction	• None (only inhibit handler)
	• Blocked blow-by valve or blocked blow-by oil filter

https://truckmanualshub.com/

Failure cause		• Check Blw-by valve and oil filter
Failure repair		[Test Condition] • If monitor not inhibited by another failure (FId_CrCsVMon not set) • engine speed is between 2000.00rpm and 3400.00rpm • atmospheric pressure EnvP_p > 75kPa {11psi, 0.8kgf/cm^2}, low altitude • environmental temperature CrCsV_tAirEnv_mp > -40.04°C {-40.07°F} • engine coolant temperature CEngDsT_t is between 59.96°C {139.93°F} and 119.96°C {247.93°F} • The current actual torque ActMod_trqInr is between 100N·m {74lbs.ft, 10kgf·m} and 450N·m {330lbs.ft, 46kgf·m}
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

84-12: Vehicle speed is not plausible to engine speed and torque.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • Not inhibited by FID_VehVMon due to another failure. • Engine speed > 1750.00rpm and engine load > (Inner modelled torque) > 150N·m {110lbs.ft, 15kgf·m} longer than 5.00s
	[Fault Detection] • All conditions below fulfilled for at least 5.00s (i.e. debouncing starts only after this delay time!): • engine speed > 1750.00rpm • engine torque > 150N·m {110lbs.ft, 15kgf·m} • vehicle speed < 6km/h {3.73mph}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 50% of the time
Fault healing	• As soon as vehicle speed > 6km/h {3.73mph}, independently on engine speed and load (“Reset” of a Flip-Flop)

https://truckmanualshub.com/

		• During error debouncing (100.00ms), the vehicle speed (VehV_v) and the acceleration (VehV_a) retain the last valid values. • After error debouncing, Vehicle speed is set to 0km/h {0mph} and Acceleration is set to 0 m/s2. • Further reactions according FID (see FID's)
System reaction		• 1) FId / Vehicle speed value (via CAN) frozen in case of preliminary failure detected • 2) FId / Vehicle speed value (via CAN) replaced by substitute value if failure is validated • 3) FId / Vehicle speed value (via HW) frozen in case of preliminary failure detected • 4) FId / Vehicle speed value (via HW) replaced by substitute value if failure is validated • 5) FId / Status of function identifier FId_EngDemTrqLimErr1 • 6) FId / Torque limitation 4 activated for power reduction • 7) FId / Engine speed Limitation 1 for HIgh/Low engine speed (HLS) control active • 8) Fid / Cruise control immediately shut off • 9) FId / Multiple state switch error, PTO disabled • 10) FId / Vehicle speed sensing error, Cruise control disabled • 11) FId / Release of OBD Performance Limiter at low vehicle speed inhibited due to a failure • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Plausibility Check Accelerator and brake pedal not released due to failure in vehicle speed evaluation • 14) FId / Inhibit Charged Air Cooler monitoring • 15) Fid / Crankshaft sensor diagnosis inhibited (due to vehicle speed implausibility, e.g. towed vehicle) • 17) FId / Drive away-set point idle speed calculation by High/Low engine speed control (HLS) inhibited • 18) FId / Underbraking disabled for High and Low engine speed control (HLS) (no special control parameters in case of Underbraking used) • 19) FId / High and Low engine speed demand control (HLS) disabled • 20) FId / Vehicle Speed signal defective, speed limiter blocked • 21) FId / Misfire Detection disabled • 22) FId / Closing of metering unit forced (full fuel feeding) • 23) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 24) FId / Vehicle speed signal evaluation defective • 25) Fid / Fix Substitution value (FE) for actual fuel economy status transmit to CAN Message FIEco • 26) FId / Status of Function Identifier for Wheel Based Vehicle Speed • 27) FId / Coolant thermostat diagnosis disabled • 28) FId / Use of the gear signal for the range check of particulate filter (DPF) is inhibited • 29) FId / Use of the vehicle speed for the range check of particulate filter (DPF) is inhibited • 30) FId / Vehicle speed sensor defective, PGNRQ can message invalid • 31) FId / Cooling fan speed set point calculation does not take into consideration vehicle speed (fix value Fans_vSubst_C used)
Failure cause		• Defective vehicle speed sensor. • Engine driven under load without PTO (i.e. external PTO) • In very cold situation possible due to "engine warming up at higher speed" and vehicle stand still (high torque request in case of "non liquid oil")
Failure repair		• Check vehicle speed sensor • Check if "external PTO" used • Check if failure occurred at very low engine temperature < -10°C {14°F})
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

84-15: Vehicle speed sensor has a maximum threshold error.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • Continuously if not inhibited by FID_VehVMon due to another failure.
	[Fault Detection] • The measured vehicle speed > 180km/h {111.85mph}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• The measured vehicle speed < 180km/h {111.85mph}.
System reaction	• During error debouncing (1000.00ms), the vehicle speed (VehV_v) and the acceleration (VehV_a) retain the last valid values. • After error debouncing, Vehicle speed is set to 0km/h {0mph} and Acceleration is set to 0 m/s2.
	• 1) FId / Vehicle speed monitoring inhibited • 2) FId / Vehicle speed value (via CAN) frozen in case of preliminary failure detected • 3) FId / Vehicle speed value (via CAN) replaced by substitute value if failure is validated • 4) FId / Vehicle speed value (via HW) frozen in case of preliminary failure detected • 5) FId / Vehicle speed value (via HW) replaced by substitute value if failure is validated • 6) FId / Status of function identifier FId_EngDemTrqLimErr1 • 7) FId / Torque limitation 4 activated for power reduction • 8) FId / Engine speed Limitation 1 for HIgh/Low engine speed (HLS) control active • 9) Fid / Cruise control immediately shut off • 10) FId / Multiple state switch error, PTO disabled • 11) FId / Vehicle speed sensing error, Cruise control disabled • 12) FId / Release of OBD Performance Limiter at low vehicle speed inhibited due to a failure • 13) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 14) FId / Plausibility Check Accelerator and brake pedal not released due to failure in vehicle speed evaluation • 15) FId / Inhibit Charged Air Cooler monitoring • 16) Fid / Crankshaft sensor diagnosis inhibited (due to vehicle speed implausibility, e.g. towed vehicle) • 17) FId / Vehicle speed assumed by engine speed and load for calculation of total driven distance of vehicle • 18) FId / Drive away-set point idle speed calculation by High/Low engine speed control (HLS) inhibited • 19) FId / Underbraking disabled for High and Low engine speed control (HLS) (no special control parameters in case of Underbraking used) • 20) FId / High and Low engine speed demand control (HLS) disabled • 21) FId / Vehicle Speed signal defective, speed limiter blocked • 22) FId / Misfire Detection disabled • 23) FId / Closing of metering unit forced (full fuel feeding) • 24) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 25) FId / Vehicle speed signal evaluation defective • 26) Fid / Fix Substitution value (FE) for actual fuel economy status transmit to CAN Message FIEco • 27) FId / Status of Function Identifier for Wheel Based Vehicle Speed • 28) FId / Coolant thermostat diagnosis disabled • 29) FId / Use of the gear signal for the range check of particulate filter (DPF) is inhibited • 30) FId / Use of the vehicle speed for the range check of particulate filter (DPF) is inhibited • 31) FId / Vehicle speed sensor defective, PGNRQ can message invalid • 32) FId / Cooling fan speed set point calculation does not take into consideration vehicle speed (fix value Fans_vSubst_C used)
Failure cause	• Real overspeed, i.e. by engine tuning (??) • Incorrect speed evaluation (depending on signal source by Wheel Speed Information, Tachograph Output, disturbed CAN)
Failure repair	• Check measuring device and replace it if necessary. • No action in case of real vehicle overspeed or engine tuning

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

91-2: Signal 'Value of accelerator pedal sensor' is implausible.

Generation condition		[Test Condition] • Continuously. • If input signals > 650.00mV. • Error is entered only if the signal path is not classified as defective (DINH_stFId.FId_APPSyncChk).
		[Fault Detection] • If the permitted maximum for the difference of both the input signals APP_uDiffMax_mp exceeds maximum value defined in applicable curve position dependent.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 250.00ms • Failure is detected if active for 25% of the time
Fault healing		• error no more detected
System reaction		• None (Except FIds)
		• 1) FId / Increased engine speed because of accelerator pedal error • 2) FId / Synchronisation error of the acceleration pedal--> depending on other test results Signal of APP1 or APP2 used • 3) FId / Function Identifier provisional synchronisation error of the acceleration pedal • 4) FId / Limp home mode activated • 5) FId / Speed Demand by tester for diagnostic tests inhibited • 6) FId / Status of function identifier FId_EngDemTrqLimErr1 • 7) FId / Torque limitation 2 activated for power reduction • 8) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 9) FId / Single Injector shut off test inhibited • 10) FId / Run Up test inhibited • 11) FId / Set point test of Metering Unit (MeUn) of Common Rail disabled • 12) FId / Fuel rail pressure control valve (PCV) set point test inhibited • 13) FId / High pressure test inhibited • 14) FId / Rail Pressure set point test inhibited
Failure cause		• Wiring problem, aged or defective accelerator pedal
Failure repair		• Check wiring and accelerator pedal
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B17 (Position sensor Accelerator pedal). Check the circuit across A4.X2.94/30 and B17.6/5 for open or short circuit. Check the circuit across A4.X2.94/57 and B17.6/4 for open or short circuit. Check the circuit across A4.X2.94/45 and B17.6/6 for open or short circuit. Check the circuit across A4.X2.94/8 and B17.6/2 for open or short circuit. Check the circuit across A4.X2.94/35 and B17.6/1 for open or short circuit. Check the circuit across A4.X2.94/46 and B17.6/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B17 (Position sensor Accelerator pedal)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X17 (Intermediate connector). Check the circuit across A4.X2.94/45 and X16.16/1 for open or short circuit. Check the circuit across A4.X2.94/46 and X16.16/5 for open or short circuit. Check the circuit across A4.X2.94/57 and X16.16/3 for open or short circuit. Check the circuit across A4.X2.94/35 and X16.16/7 for open or short circuit. Check the circuit across A4.X2.94/30 and X16.16/3 for open or short circuit. Check the circuit across A4.X2.94/8 and X16.16/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across B17 (Position sensor Accelerator pedal) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

91-3: Signal Range Check High for Accelerator Pedal Position 1.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Continuously.
	[Fault Detection] • If the signal exceeds the applicable threshold 4.80V, a signal range violation is detected. • Error is entered only if the signal path is not classified as defective (DINH_stFId.FId_APP1SigPath not set by another failure).
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time

https://truckmanualshub.com/

Fault healing		• If the signal is below the applicable threshold 4.80V, the signal range violation is reset after the healing debouncing.
System reaction		• No substitute value is formed in the device driver. The read in signal is relayed unchanged to the layers above it.
		• 1) FId / SRC High on APP1 detected --> APP1 Signal not usable • 2) FId / Status of function identifier FId_EngDemTrqLimErr1 • 3) FId / Torque limitation 2 activated for power reduction • 4) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Short circuit of wiring to external source or inside accelerator pedal
Failure repair		• Check wiring or replace accelerator pedal
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B17 (Position sensor Accelerator pedal). Check the circuit across A4.X2.94/30 and B17.6/5 for open or short circuit. Check the circuit across A4.X2.94/57 and B17.6/4 for open or short circuit. Check the circuit across A4.X2.94/45 and B17.6/6 for open or short circuit. Check the circuit across A4.X2.94/8 and B17.6/2 for open or short circuit. Check the circuit across A4.X2.94/35 and B17.6/1 for open or short circuit. Check the circuit across A4.X2.94/46 and B17.6/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B17 (Position sensor Accelerator pedal)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X17 (Intermediate connector). Check the circuit across A4.X2.94/45 and X16.16/1 for open or short circuit. Check the circuit across A4.X2.94/46 and X16.16/5 for open or short circuit. Check the circuit across A4.X2.94/57 and X16.16/3 for open or short circuit. Check the circuit across A4.X2.94/35 and X16.16/7 for open or short circuit. Check the circuit across A4.X2.94/30 and X16.16/3 for open or short circuit. Check the circuit across A4.X2.94/8 and X16.16/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across B17 (Position sensor Accelerator pedal) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

91-4: Signal Range Check Low for Accelerator Pedal position 1.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Continuously.
		[Fault Detection] • If the signal is below the applicable threshold 550.00mV, a signal range violation is detected. • Error is entered only if the signal path is not classified as defective (DINH_stFId.FId_APP1SigPath not set by another failure).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal exceeds the applicable threshold 550.00mV, the signal range violation is reset after the healing debouncing.
System reaction		• No substitute value is formed in the device driver. The read in signal is relayed unchanged to the layers above it.
		• 1) FId / SRC High on APP1 detected --> APP1 Signal not usable • 2) FId / Status of function identifier FId_EngDemTrqLimErr1 • 3) FId / Torque limitation 2 activated for power reduction • 4) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Short circuit to ground in wiring or in accelerator pedal
Failure repair		• Check wiring or replace accelerator pedal
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B17 (Position sensor Accelerator pedal). Check the circuit across A4.X2.94/30 and B17.6/5 for open or short circuit. Check the circuit across A4.X2.94/57 and B17.6/4 for open or short circuit. Check the circuit across A4.X2.94/45 and B17.6/6 for open or short circuit. Check the circuit across A4.X2.94/8 and B17.6/2 for open or short circuit. Check the circuit across A4.X2.94/35 and B17.6/1 for open or short circuit. Check the circuit across A4.X2.94/46 and B17.6/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B17 (Position sensor Accelerator pedal)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X17 (Intermediate connector). Check the circuit across A4.X2.94/45 and X16.16/1 for open or short circuit. Check the circuit across A4.X2.94/46 and X16.16/5 for open or short circuit. Check the circuit across A4.X2.94/57 and X16.16/2 for open or short circuit. Check the circuit across A4.X2.94/35 and X16.16/6 for open or short circuit. Check the circuit across A4.X2.94/30 and X16.16/2 for open or short circuit. Check the circuit across A4.X2.94/8 and X16.16/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across B17 (Position sensor Accelerator pedal) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

97-9: CAN timeout error while communicating with control unit 'ECM'

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Fault is detected if a Timeout of the WFI frame has occurred.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Message is acknowledged
System reaction		• None
		• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure cause		• Check the presence and correct connection of the EDC to the network, Check correct functioning of the CAN controller. Check wiring.
Failure repair		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

100-2: Component 'Oil pressure switch' has a mechanical defect.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state and 2.00s after last CAN controller is no more in bus-off state • When engine is switched off (Epm_nEng == 0).
		[Fault Detection] • Oil pressure is present, digital oil pressure switch active (Oil_stPSwmp == TRUE)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 15.00s • Failure is detected if active for 25% of the time
Fault healing		• Either oil pressure reduces (Oil_stPSwmp == FALSE) or engine is switched on.
System reaction		• None except FIDs
		• 1) FId / Inhibit Oil pressure measurement
Failure cause		• Oil pressure digital switch defective
Failure repair		• Check oil pressure digital switch
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

100-31: The oil pressure is too low.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state and 2.00s after last CAN controller is no more in bus-off state • When engine is running (engine speed Epm_nEng > 500.00rpm).
	[Fault Detection] • Oil pressure is not present, oil pressure digital switch not active (Oil_stPSwmp == FALSE)
	[Defect Debouncing] • Debounce time is oil temperature dependent, indicated value is valid if temperature > 60°C {140°F} (debounce longer at lower temperatures) Debouncing time is depend on coolant temperature and between 25.00s at -30.04°C {-22.07°F} and 4.00s at 79.96°C {175.93°F}.
Fault healing	• Either oil pressure increases (Oil_stPSwmp == TRUE) when engine is running (Epm_nEng > 500.00rpm).
System reaction	• None except FIDs
	• 1) FId / Inhibit Oil pressure measurement
Failure cause	• Low oil pressure or digital oil pressure switch blocked
Failure repair	• Check oil level and pressure, check oil pressure switch

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

101-2: Engine stops in run-on mode. The value of component 'Pressure sensor in crankcase' is implausible.

Generation condition		[Test Condition] • During after-run
		[Fault Detection] • Absolute value of CrCsP2_p > 2.5kPa {0.4psi, 0.025kgf/cm^2} for at least 5.00s
		[Defect Debouncing] • Immediate
Fault healing		• Only possible at next afterrun if absolute value of • CrCsP2_p < 2.5kPa {0.4psi, 0.025kgf/cm^2} for at least 3.00s
System reaction		• None except FIDs
		• 1) FId / Inhibit physical range check for crankcase pressure 2 • 2) FId / Inhibit crankcase ventilation monitoring
Failure cause		• Inaccurate or defective crankcase differential pressure sensor
Failure repair		• Check sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B58 (Blow-by gas pressure sensor 1). Check the circuit across B58.3/3 and A4.X1.60/9 for open or short circuit. Check the circuit across B58.3/2 and A4.X1.60/28 for open or short circuit. Check the circuit across B58.3/1 and A4.X1.60/59 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B58 (Blow-by gas pressure sensor 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

https://truckmanualshub.com/

102-0: Signal value of Boost pressure sensor is above maximum limit.

Generation condition	[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
	[Fault Detection] • The sensed raw voltage value boost pressure Air_uRawPIntkVUs is above 4.91V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensed raw voltage value boost pressure Air_uRawPIntkVUs is below 4.91V
System reaction	• Boost pressure is frozen at last valid value on preliminary failure and ramps, using slope 80kPa {12psi, 0.8kgf/cm^2}/s or 80kPa {12psi, 0.8kgf/cm^2}/s depending whether the measured value is above or below replacement value, to a default value of 160kPa {23psi, 1.6kgf/cm^2} if failure is validated. • Further reactions according FID (see FID's)
	• 1) FId / Check of gain plausibility of air flow meter (HFM/AFS) at low idle disabled • 2) FId / Inhibit Charged Air Cooler monitoring • 3) FId / Reciprocal lambda signal replaced by substitute value for modelling • 4) FId / Calculation of Turbocharger Compressor Temperature inhibited • 5) Fid / Fix substitution value (FEh) of Boost pressure transmit to CAN Message INCON (Inlet/Exhaust condition) • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 7) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 8) FId / Status of function identifier FId_EngDemTrqLimErr1 • 9) FId / Torque limitation 2 activated for power reduction • 10) FId / Engine overheat protection active • 11) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 12) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 13) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 14) FId / The Adaptation of lambda Sensor disabled • 15) FId / The Difference Check between several Lambda Sensors is disabled • 16) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 17) FId / Electrical Open Load Check of Lambda Sensor disabled • 18) FId / O2 Signal of Lambda Sensor not valid • 19) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 20) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 21) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 22) FId / CLosed Loop Boost pressure governor shut off due to a System error • 23) FId / Inhibit DPF monitor • 24) FId / Inhibit plausibility test of the Intake Valve upstream air pressure sensor • 25) FId / Freeze Intake Valve upstream air pressure value at preliminary failure detection • 26) FId / Inhibit Physical range check for the sensed pressure, upstream of intake-valve • 27) FId / Replace Intake Valve upstream air pressure value with fix value • 28) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 29) FId / Inhibit Charged Air Cooler monitoring • 30) FId / EGR switched off • 31) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled
Failure cause	• Short circuit of sensor to external source or defective sensor
Failure repair	• Check wiring or replace sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B19 (Pressure and temperature sensor Turbocharger). Check the circuit across B19.4/3 and A4.X1.60/25 for open or short circuit. Check the circuit across B19.4/2 and A4.X1.60/12 for open or short circuit. Check the circuit across B19.4/4 and A4.X1.60/13 for open or short circuit. Check the circuit across B19.4/1 and A4.X1.60/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B19 (Pressure and temperature sensor Turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Perform learning of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

102-1: Signal value of Boost pressure sensor is below minimum limit.

Generation condition	[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
	[Fault Detection] • The sensed raw voltage value of boost pressure sensor Air_uRawPIntkVUs is below 178.40mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensed raw voltage value Air_uRawPIntkVUs is above 178.40mV

https://truckmanualshub.com/

System reaction		• Boost pressure is frozen at last valid value on preliminary failure and ramps, using slope 80kPa {12psi, 0.8kgf/cm^2}/s or 80kPa {12psi, 0.8kgf/cm^2}/s depending whether the measured value is above or below replacement value, to a default value of 160kPa {23psi, 1.6kgf/cm^2} if failure is validated. • Further reactions according FID (see FID's)

	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

102-17: Signal 'Boost pressure' of component 'Boost pressure sensor' is implausible. Data valid but below normal operational range

Generation condition	[Test Condition] • Boost pressure sensor is reliable (FId_PIntkVUsEnvPPls not set) • Engine speed <660.00rpm • Throttle valve set point > 90.00% with no regeneration request • Fuel quantity < 7.00mg/hub
	[Fault Detection] • The difference between boost pressure minus environmental pressure (Air_pSensPIntkVUs - EnvP_pSens) < -7kPa {-1.0psi, -0.07kgf/cm^2}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing	• The difference between boost pressure minus environmental pressure (Air_pSensPIntkVUs - EnvP_pSens) > -7kPa {-1.0psi, -0.07kgf/cm^2}

https://truckmanualshub.com/

System reaction		• None except FIds
		• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 5) FId / Status of function identifier FId_EngDemTrqLimErr1 • 6) FId / Torque limitation 2 activated for power reduction • 7) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 8) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 9) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 10) FId / CLosed Loop Boost pressure governor shut off due to a System error • 11) FId / Inhibit DPF monitor • 12) FId / Particulate filter ((DPF) Regeneration inhibited • 13) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 14) FId / Inhibit Charged Air Cooler monitoring • 15) FId / Calculation of Turbocharger Compressor Temperature inhibited • 16) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled
Failure cause		• Inaccurate or defective boost pressure sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the boost pressure sensor and replace it if necessary
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B19 (Pressure and temperature sensor Turbocharger). Check the circuit across B19.4/3 and A4.X1.60/25 for open or short circuit. Check the circuit across B19.4/2 and A4.X1.60/12 for open or short circuit. Check the circuit across B19.4/4 and A4.X1.60/13 for open or short circuit. Check the circuit across B19.4/1 and A4.X1.60/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B19 (Pressure and temperature sensor Turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Perform learning of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

102-18: Signal value of Boost pressure sensor is below minimum limit.

Generation condition	[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
	[Fault Detection] • The sensed sensor signal Air_pSensPIntkVUs is below 15kPa {2.2psi, 0.15kgf/cm^2}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensed sensor signal Air_pSensPIntkVUs is above 15kPa {2.2psi, 0.15kgf/cm^2}
System reaction	• Boost pressure is frozen at last valid value on preliminary failure and ramps, using slope 80kPa {12psi, 0.8kgf/cm^2}/s or 80kPa {12psi, 0.8kgf/cm^2}/s depending whether the measured value is above or below replacement value, to a default value of 160kPa {23psi, 1.6kgf/cm^2} if failure is validated. • Further reactions according FID (see FID's)
	• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 3) Fid / The actual Boost pressure is corrected by a fix value (Air_pPCRDflPCACDs_C) instead by the actual boost temperature for the Boost pressure control • 4) FId / Inhibit plausibility test of the Intake Valve upstream air pressure sensor • 5) FId / Freeze Intake Valve upstream air pressure value at preliminary failure detection • 6) FId / Replace Intake Valve upstream air pressure value with fix value • 7) FId / EGR switched off • 8) FId / Inhibit Charged Air Cooler monitoring • 9) FId / Calculation of Turbocharger Compressor Temperature inhibited • 10) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 11) FId / Status of function identifier FId_EngDemTrqLimErr5 • 12) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause	• Inaccurate or defective boost pressure sensor, defect in the wiring
Failure repair	• Check wiring and the accuracy of the boost pressure sensor and replace it if necessary

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B19 (Pressure and temperature sensor Turbocharger). Check the circuit across B19.4/3 and A4.X1.60/25 for open or short circuit. Check the circuit across B19.4/4 and A4.X1.60/13 for open or short circuit. Check the circuit across B19.4/2 and A4.X1.60/12 for open or short circuit. Check the circuit across B19.4/1 and A4.X1.60/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B19 (Pressure and temperature sensor Turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Perform learning of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

105-0: Signal Range Check (SRC) for ‘Boost temperature’ reports HIGH.

Generation condition	[Test Condition] • ADC has not reported a module error (no failure “ADC...” active). • Continuous Monitoring
	[Fault Detection] • The sensor raw signal is above 3.23V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensor raw signal is below 3.23V.

https://truckmanualshub.com/

System reaction		• If there is no error in environment air temperature sensor module (FId_TCACDsModel not set) then the substitute value in case of error in Boost temperature is the sum of environmental air temperature and an offset -0.04°C {31.93°F}. • If there is an error in Environment Temperature sensor module, then the Boost temperature reaches the default value 29.96°C {85.93°F} via a ramp with the slopes 10.00K/s (ramping down) or 10.00K/s (ramping up). • Further reaction by FID (see FID)
		• 1) FId / Replacement value for start temperatures is used for modelling • 2) FId / Reciprocal lambda signal replaced by substitute value for modelling • 3) FId / Inhibit Charged Air Cooler monitoring • 4) FId / Fix substitution value (FEh) of Boost temperature transmit to CAN Message INCON (Inlet/Exhaust condition) • 5) Fid / Boost temperature not considered for engine start temperature evaluation • 6) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 7) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 8) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 9) FId / Use of the induction air temperature for the range check of particulate filter (DPF) is inhibited • 10) FId / Freeze the value of Exh_pPFltUs in case of a preliminary defect. • 11) FId / Boost temperature by model or fix value (temporary) • 12) FId / Boost temperature by model or fix value (permanent) • 13) Fid / Plausibility Check between Boost and second temperature disabled • 14) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 15) FId / Detection of cooled down combustion chamber for Zero Fuel Calibration(ZFC) disabled • 16) FId / Inhibit Charged Air Cooler monitoring • 17) FId / Inhibit temperature sampling • 18) FId / Inhibit the Environment temperature plausibility check • 19) FId / Inhibit physical range check on the sensed value of the intake air temperature sensor.
Failure cause		• Sensor defective or short circuit to external source
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B19 (Pressure and temperature sensor Turbocharger). Check the circuit across B19.4/3 and A4.X1.60/25 for open or short circuit. Check the circuit across B19.4/4 and A4.X1.60/13 for open or short circuit. Check the circuit across B19.4/2 and A4.X1.60/12 for open or short circuit. Check the circuit across B19.4/1 and A4.X1.60/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B19 (Pressure and temperature sensor Turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Perform learning of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5

105-1: Signal Range Check (SRC) for 'Boost temperature' reports LOW.

Generation condition	[Test Condition] • ADC has not reported a module error (no failure "ADC..." active). • Continuous Monitoring
	[Fault Detection] • The sensor raw signal is below 130.40mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensor raw signal is above 130.40mV.
System reaction	• If there is no error in environment air temperature sensor module (FId_TCACDsModel not set) then the substitute value in case of error in Boost temperature is the sum of environmental air temperature and an offset -0.04°C {31.93°F}. • If there is an error in Environment Temperature sensor module, then the Boost temperature reaches the default value 29.96°C {85.93°F} via a ramp with the slopes 10.00K/s (ramping down) or 10.00K/s (ramping up). • Further reaction by FID (see FID)
	• 1) FId / Replacement value for start temperatures is used for modelling • 2) FId / Reciprocal lambda signal replaced by substitute value for modelling • 3) FId / Inhibit Charged Air Cooler monitoring • 4) FId / Fix substitution value (FEh) of Boost temperature transmit to CAN Message INCON (Inlet/Exhaust condition) • 5) Fid / Boost temperature not considered for engine start temperature evaluation • 6) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 7) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 8) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 9) FId / Use of the induction air temperature for the range check of particulate filter (DPF) is inhibited • 10) FId / Freeze the value of Exh_pPFltUs in case of a preliminary defect. • 11) FId / Boost temperature by model or fix value (temporary) • 12) FId / Boost temperature by model or fix value (permanent) • 13) Fid / Plausibility Check between Boost and second temperature disabled • 14) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 15) FId / Detection of cooled down combustion chamber for Zero Fuel Calibration(ZFC) disabled • 16) FId / Inhibit Charged Air Cooler monitoring • 17) FId / Inhibit temperature sampling • 18) FId / Inhibit the Environment temperature plausibility check • 19) FId / Inhibit physical range check on the sensed value of the intake air temperature sensor.
Failure cause	• Sensor defective or short circuit to ground • Note: This failure can also be detected, if a very high boost temperature occured (> 350°C {662°F}) e.g. due to full flow of non cooled EGR or fire....
Failure repair	• Check wiring or replace sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check to see if EGR cooler is fully operational. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B19 (Pressure and temperature sensor Turbocharger). Check the circuit across B19.4/3 and A4.X1.60/25 for open or short circuit. Check the circuit across B19.4/4 and A4.X1.60/13 for open or short circuit. Check the circuit across B19.4/2 and A4.X1.60/12 for open or short circuit. Check the circuit across B19.4/1 and A4.X1.60/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B19 (Pressure and temperature sensor Turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Perform learning of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

110-0: Signal Range Check (SRC) for 'Coolant temperature' reports HIGH.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously
	[Fault Detection] • The sensor raw signal > 4.94V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensor raw signal < 4.94V.

https://truckmanualshub.com/

	• Failure detected at start: The Engine Coolant Temperature value jumps to the fixed replacement value 9.96°C {49.93°F}. As son as engine is in running condition, the temperature ramps to 79.96°C {175.93°F} with the slope 0.07K/s, i.e. 79.96°C {175.93°F} is reached 936.229402953135 sec after engine start. • Failure detected during engine running: • The Engine Coolant Temperature ramps to the fixed replacement value 79.96°C {175.93°F} (engine in running condition) with 1.00K/s (rising up) or 1.00K/s (rising down) • Further reactions according FID (see FID's)
System reaction	• 1) FId / Replacement value for start temperatures is used for modelling • 2) FId / Absolute and dynamic monitoring of Coolant temperature inhibited • 3) FId / Last Valid value for Coolant Temperature is frozen and used • 4) FId / Fixed Default value for Coolant Temperature is taken • 5) FId / Fan logic uses fuel or oil temperature instead of defective coolant temperature value • 6) Fid / Fix Substitution value instead of calculated Nominal friction of engine transmit to CAN (EEC3) • 7) FId / Coolant thermostat diagnosis disabled • 8) FId / Modelled Environmental temperature for Coolant Thermostat diagnosis not usable (only measured temp) • 9) FId / Dew Point detection for Lambda Sensor (LSU) not possible - LSU Heater switched on after a fix time • 10) FId / EGR cooling inactive • 11) Fid / Coolant temperature not considered for engine start temperature evaluation • 12) FId / Fan speed calculation uses oil temperature instead of coolant temperature • 13) FId / Default value for engine temperature transmitted via CAN • 14) FId / The Coolant Temperature can not be used for substitution of fuel temperature • 15) FId / Fix value (HLSDem_tDflSetPLo_C) taken instead of Engine temperature for minimum chose with Oil temperature for Start temperature evaluation for Hig/Low engine speed control (HLS) • 16) Fid / Calculation of the piezo actuator temperature disabled • 17) FId / Run Up test inhibited • 18) FId / Pressure Compensation of O2-Signal can not be learnt - is taken from the curve (LSU_facPresComLean_CUR) • 19) FId / Actuator test for Metering Unit (MeUn) of Common Rail disabled • 20) FId / Set point test of Metering Unit (MeUn) of Common Rail disabled • 21) FId / Misfire Detection disabled • 22) FId / Substitute reaction: violation of a running condition and the pcv test will not be executed • 23) FId / Fuel rail pressure control valve (PCV) set point test inhibited • 24) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 25) FId / Pressure wave correction of cylinder specific fuel quantity (QWC) disabled (due to defective Coolant Temp Sensor) • 26) FId / High pressure test inhibited • 27) FId / Offset test of Rail pressure sensor disabled • 28) FId / Offset test of Rail pressure sensor only released, if this failure path is tested • 29) FId / Rail Pressure set point test inhibited • 30) FId / Electrical engine coolant heater switched off • 31) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 32) FId / Inhibit Charged Air Cooler monitoring • 33) FId / Inhibit OxiCat passive monitor • 34) FId / Inhibit plaus.check engine coolant temperature at cold start • 35) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 36) FId / Inhibit physical range check engine coolant temperature • 37) FId / Inhibit EGR cooler efficiency monitoring • 38) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause	• Sensor defective or short circuit to external source
Failure repair	• Check wiring or replace sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X1.60/55 and B39.2/1 for open circuit. Check electrical line between pins A4.X1.60/23 and B39.2/2 for open circuit. Check electrical line between pins A4.X1.60/55 and B39.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B39 (Coolant temperature sensor) for short-circuit to another line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B39 (Coolant temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step1

110-1: Signal Range Check (SRC) for ‘Coolant temperature’ reports LOW.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously
	[Fault Detection] • The sensed signal < 232.20mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Sensor signal > 232.20mV

https://truckmanualshub.com/

	• Failure detected at start: The Engine Coolant Temperature value jumps to the fixed replacement value 9.96°C {49.93°F}. As son as engine is in running condition, the temperature ramps to 79.96°C {175.93°F} with the slope 0.07K/s, i.e. 79.96°C {175.93°F} is reached 936.229402953135 sec after engine start. • Failure detected during engine running: • The Engine Coolant Temperature ramps to the fixed replacement value 79.96°C {175.93°F} (engine in running condition) with 1.00K/s (rising up) or 1.00K/s (rising down) • Further reactions according FID (see FID's)

111-1: The coolant level is too low.Data valid but below normal operational range

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn’t running yet, while the engine isn’t cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • If the coolant level is low, i.e. if the message ClntLv_st is set for longer than 1000.00ms.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 25% of the time
Fault healing	• If the coolant level is within limit, i.e if the message ClntLv_st is reset for longer than 1000.00ms.
System reaction	• None
	• Coolant level low or switch not working correctly
Failure cause	• Check coolant level • If OK, check coolant switch.
Failure repair	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn’t running yet, while the engine isn’t cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

129-16: Fuel pressure control CPC: Fuel rail pressure exceeds maximal limit during rail press control “both devices”. Data Valid But Above Normal Operational Range.

Generation condition		[Test Condition] • Engine normal running • Fuel pressure control in mode “both devices” switching to “only PCV” or “only MeUn” (Rail_stCtlLoop = 16 or 17 or 18) • FID_RailTnkLo not set due to Failure FlSysTnkLo (see description of Fl-SysTnkLo)
		[Fault Detection] • The rail pressure > 215MPa {31180psi, 2190kgf/cm^2}
		[Defect Debouncing] • Defect condition fulfilled continuously >240.0 ms
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• According FID (see FID’s)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel pressure control exclusively made by metering unit (MeUn) in current driving cycle • 3) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 4) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Pressure control valve (PCV) stuck in closed position • Too high current to PCV (due to partial short circuit) • Metering Unit (MeUn) stuck if “full feeding position” • Metering Unit (MeUn) without current • Zero delivery throttle clogged or pressure after Zero delivery valve to high (due to clogged return tubes) • Pressure before gear pump too high due to clogged pressure control valve in low pressure cycle (if present)
Failure repair		• Check Pressure control valve (PCV), if opening (PWM = 0%) • Check metering Unit (MeUn), if closing (PWM = 100%) • Check electric wiring to PCV and MeUn • Check low pressure fuel tubes (return from CP to tank free?) • Check zero delivery valve for correct working
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘Y29 (Pressure limiting valve in rail)’ is faulty. Faulty Y29 (Pressure limiting valve in rail) harness Component ‘Y10 (Pressure regulating valve in rail)’ is faulty. Faulty Y10 (Pressure regulating valve in rail) harness Plugged A41 (Electric fuel pump) Plugged Fuel return line For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y29 (Pressure limiting valve in rail). Check the circuit across B1.2/2[SIG] and A4.X1.60/45 for open or short circuit. Check the circuit across B1.1/2[GND] and A4.X1.60/15 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step9
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “Y29 (Pressure limiting valve in rail)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y29 (Pressure limiting valve in rail) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step6
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘Y29 (Pressure limiting valve in rail)’ is faulty. Faulty Y29 (Pressure limiting valve in rail) harness Component ‘Y10 (Pressure regulating valve in rail)’ is faulty. Faulty Y10 (Pressure regulating valve in rail) harness Plugged A41 (Electric fuel pump) Plugged Fuel return line For procedures, refer to the Shop Manual Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step4

129-18: Fuel pressure control CPC: Fuel rail pressure below minimal threshold during rail press control “both devices”.Data valid but below normal operational range

Generation condition	[Test Condition] • Engine normal running • Fuel pressure control in mode “both devices” switching to “only PCV” or “only MeUn” (Rail_stCtlLoop = 16 or 17 or 18) • FID_RailTnkLo not set due to Failure FlSysTnkLo (see description of FlSysTnkLo)
	[Fault Detection] • If the rail pressure RailP_pFlt < pressure threshold based on the engine speed. (from 12000kPa {1740psi, 120kgf/cm^2} at 600.00rpm over 12000kPa {1740psi, 120kgf/cm^2} at 1600.00rpm to 12000kPa {1740psi, 120kgf/cm^2} at 3600.00rpm)
	[Defect Debouncing] • Defect condition fulfilled continuously >300.0 ms

https://truckmanualshub.com/

Fault healing		• No Healing possible (disabled by Data set)
System reaction		• According FID (see FID's)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel pressure control exclusively made by metering unit (MeUn) in current driving cycle • 3) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 4) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Possible faults in high pressure part. • injection nozzle stuck in open position, low efficiency of high pressure pump, internal leakage of injector, leaking pressure control valve, leaking high pressure part itself (tubing) • Too low pressure at High pressure pump inlet due clogged filter, leaking low pressure tubes, electric pre supply pump defective or gear pump defective
Failure repair		• Check low pressure system for clogging (specially fuel filter) • Check tubing between pre supply and gear pump • Check feeding of presupply pump (possibly low due to clogged tubes at tank outlet) • Check high pressure part for leakages (internal / external) • Check PCV for tightness in closed position (100% PWM) • Check High pressure pump for efficiency • Check injectors for tightness
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'Common rail' is faulty. Component 'Fuel injector' is stuck. Reduced pressure of Supply pump Fuel leakage of Fuel injector Fuel leakage of Y29 (Pressure limiting valve in rail) Fuel leakage of Fuel pipe Plugged Fuel filter module Component 'A41 (Electric fuel pump)' is faulty. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y29 (Pressure limiting valve in rail). Check the circuit across B1.2/2[SIG] and A4.X1.60/45 for open or short circuit. Check the circuit across B1.1/2[GND] and A4.X1.60/15 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step9
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component "Y29 (Pressure limiting valve in rail)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y29 (Pressure limiting valve in rail) which A4 (Combustion engine Control unit) learns. Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step6
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'Common rail' is faulty. Component 'Fuel injector' is stuck. Reduced pressure of Supply pump Fuel leakage of Fuel injector Fuel leakage of Y29 (Pressure limiting valve in rail) Fuel leakage of Fuel pipe Plugged Fuel filter module Component 'A41 (Electric fuel pump)' is faulty. For procedures, refer to the Shop Manual Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step4

132-0: Air flow meterSignal Range Check (SRC) for 'raw value in HFM6 sensor' reports HIGH.Data Valid But Above Normal Operational Range.

Generation condition	[Test Condition] • Monitoring is active while the engine isn't cranking, 2.00s after engine start-up and if the ECU is not in afterrun • The SRC High check of the raw air mass is released at the start of the driving cycle if: • Fid_AFSSRC is not set by another failure • engine speed between 0.00rpm and 5000.00rpm • Continuously.
	[Fault Detection] • Raw periodic signal of HFM > 833.35us
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Raw periodic signal of HFM < 833.35us

https://truckmanualshub.com/

		• No substitute function is active during defect debouncing. After the defect debouncing time has elapsed, switchover to the modelled replace value ASMod_dmIndAirRef or, if the model cannot be used because of another failure (FId_AFSSysErr present) a replacement value from a map depending on engine speed and pressure in the induction volume is used.
System reaction		• 1) FId / Air mass flow calculated by gas equation (boost pressure, boost temperature, engine speed) instead of measuring by air flow meter (HFM/AFS) • 2) FId / Freezes last value of measured air mass of air flow meter (HFM/AFS) • 3) FId / Physical range check on the sensed value of the intake air mass sensor.(HFM/AFS) • 4) FId / Offset plausibility check of air flow meter (HFM/AFS) at engine stand still disabled • 5) FId / Check of gain plausibility of air flow meter (HFM/AFS) at low idle disabled • 6) FId / EGR switched off • 7) FId / Deactivates NOx monitoring • 8) FId / Dew Point detection for Lambda Sensor (LSU) not possible - LSU Heater switched on after a fix time • 9) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 10) FId / Engine brake position in open loop (closed loop control for exhaust flow suppressed) • 11) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 12) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 13) FId / The Adaptation of lambda Sensor disabled • 14) FId / The Difference Check between several Lambda Sensors is disabled • 15) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 16) FId / Electrical Open Load Check of Lambda Sensor disabled • 17) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 18) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 19) FId / Inhibit DPF monitor • 20) FId / Particulate filter ((DPF) Regeneration inhibited • 21) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 22) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 23) FId / Status of function identifier FId_EngDemTrqLimErr5 • 24) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Defect in wiring, defective air mass sensor
Failure repair		• Check wiring of the air mass sensor, replace air mass sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

132-18: Signal Range Check (SRC) for 'Air mass flow' reports Implausible data.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • Test is performed only if there are no errors in AFS module (DINH_stFId.FId_AFSPhysRngChk not set by another failure). Continuously.
		[Fault Detection] • The air mass flow AFS_dm is below -10.00Kg/h
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• The air mass flow AFS_dm is above or equal to -10.00Kg/h
System reaction		• None (only via the inhibit handler)
		• 1) FId / Air mass flow calculated by gas equation (boost pressure, boost temperature, engine speed) instead of measuring by air flow meter (HFM/AFS) • 2) FId / Check of gain plausibility of air flow meter (HFM/AFS) at low idle disabled • 3) FId / EGR switched off • 4) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 5) FId / Deactivates NOx monitoring • 6) FId / Replacement value for OxiCat temperature downstream used for modelling • 7) FId / Particulate filter ((DPF) Regeneration inhibited • 8) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 9) FId / Reciprocal lambda signal replaced by substitute value for modelling • 10) FId / Dew Point detection for Lambda Sensor (LSU) not possible - LSU Heater switched on after a fix time • 11) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 12) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 13) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 14) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 15) FId / Inhibit DPF monitor • 16) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 17) FId / Status of function identifier FId_EngDemTrqLimErr5 • 18) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Inaccurate or defective air mass sensor, or defect in the wiring of the HFM sensor
Failure repair		• Check wiring and the accuracy of the air mass sensor and replace it if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

132-20: Air flow meterOffset drift high error for HFM sensor at engine stand still.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • The check is carried out at ECM start before engine cranking, 5.00s after turning key on, during a period of 300.00ms, if FId_AFSPlOffsDrft is not set by another failure. • Engine speed must be 0 during test.
	[Fault Detection] • periodic HFM signal > 606.00us.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 50% of the time
Fault healing	• periodic HFM signal < 606.00us. • Healing is possible only during next driving cycle
System reaction	• None (only via the inhibit handler)
	• 1) FId / Replacement value for OxiCat temperature downstream used for modelling • 2) FId / Reciprocal lambda signal replaced by substitute value for modelling • 3) FId / EGR switched off • 4) FId / Dew Point detection for Lambda Sensor (LSU) not possible - LSU Heater switched on after a fix time • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / Engine brake position in open loop (closed loop control for exhaust flow suppressed) • 7) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 8) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 9) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 10) FId / Inhibit DPF monitor • 11) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 12) FId / Substitute calibration array is used to determinate the regeneration lock-out time of particulate filter (DPF) • 13) FId / Substitute parameter set of maximum values is used for the calculation of fuel consumption, operating hours and distance covered since the last successful regeneration of particulate filter (DPF) • 14) FId / Particulate filter ((DPF) Regeneration inhibited • 15) FId / Soot mass calculation of particulate filter (DPF) deactivated, only simulation is used. • 16) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 17) FId / Friction torque due to particulate filter (DPF) flow resistance set to • 18) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 19) FId / Inhibit Charged Air Cooler monitoring • 20) FId / Status of function identifier FId_EngDemTrqLimErr5 • 21) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause	• Inaccurate or defective air mass sensor, or defect in the wiring of the HFM sensor.

https://truckmanualshub.com/

Failure repair		• Check wiring and the accuracy of the air mass sensor and replace it if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

132-21: Air flow meterOffset drift low error for HFM sensor at engine stand still.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • The check is carried out at ECM start before engine cranking, 5.00s after turning key on, during a period of 300.00ms, if FId_AFSPlOffsDrft is not set by another failure. • Engine speed must be 0 during test.
	[Fault Detection] • Periodic HFM signal < 467.00us.

	Step4	Inspection procedure Turn the starter switch in OFF. Replace component "B51 (Rail pressure sensor)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B51 (Rail pressure sensor) which A4 (Combustion engine Control unit) learns. Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

156-18: Sensor raw value of rail pressure sensor is below minimum offset.

Generation condition	[Test Condition] • No electrical failure of sensor nor power stage active Monitoring carried out once a driving cycle during the after-run, if: • fuel temperature > 4.96°C {40.93°F} • waiting time depending on actual fuel pressure at “Key 15 off” elapsed, to guarantee, that he fuel pressure is dropped to ambient pressure
	[Fault Detection] • At afterrun: The Voltage of rail pressure sensor < 424.00mV for 3.00-
	[Defect Debouncing] • immediately Defect condition fulfilled continuously at Afterrun: 3.00-
Fault healing	• Healing only possible at afterrun of next driving cycle, if no failure detected.
System reaction	• Only according FID (see FID’s)
	• 1) Fid / Correction due to engine operating mode transitions inhibited • 2) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 3) FId / Status of function identifier FId_EngDemTrqLimErr1 • 4) FId / Torque limitation 2 activated for power reduction • 5) FId / Calibration of actuation time for injectors executed • 6) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 7) FId / Injector preparation before first energising disabled • 8) FId / Pressure wave correction of cylinder specific fuel quantity (QWC) disabled • 9) FId / Closed loop Control of Fuel Rail pressure disabled (open loop control by pre control map for MeUn and PCV) • 10) FId / Default Rail Pressure value instead of measured pressure used • 11) FId / Accepted range of Fuel Rail pressure set point by fix min and max value instead of engine speed and load dependant limits • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 15) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 16) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 17) FId / Inhibit monitor for DPF frequent regeneration • 18) FId / Inhibit monitor for incomplete regeneration of the DPF • 19) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause	• Rail pressure sensor inaccurate

https://truckmanualshub.com/

Failure repair		• Ensure correct wiring and proper functioning of rail pressure sensor, replace sensor • Replace sensor if necessary and reset learning values in EEPROM / start New learning
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B51 (Rail pressure sensor). Check the circuit across B51.3/3 and A4.X1.60/39 for open or short circuit. Check the circuit across B51.3/2 and A4.X1.60/43 for open or short circuit. Check the circuit across B51.3/1 and A4.X1.60/8 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B51 (Rail pressure sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B51 (Rail pressure sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

158-0: Signal Range Check (SRC) for ‘Battery voltage’ reports HIGH.

Generation condition	[Test Condition] • Continuously excepted when ECM is in pre drive mode (test phase immediately after ECM ignition) or monitoring is inhibited by FId_BattUSRC set by another failure.
	[Fault Detection] • The sensor raw signal BattU_uRaw (voltage) is above 2.31V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time

https://truckmanualshub.com/

Fault healing		• The sensor raw signal BattU_uRaw (voltage) is equal to or below 2.31V.
System reaction		• The sensed battery voltage value is used. • Further reactions according FID (see FID's)
		• 1) FId / Detected battery voltage error (via CAN) • 2) FId / The glow plug and the glow plug control lamp are switched off • 3) FId / Calibration of Lambda Sensor disabled due to invalid Voltage Signal on CJ125 Power stage • 4) FId / The Difference Check between several Lambda Sensors is disabled • 5) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 6) FId / Electrical Open Load Check of Lambda Sensor disabled • 7) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 8) FId / Use of the battery voltage for the range check of particulate filter (DPF) is inhibited • 9) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure)
Failure cause		• Alternator voltage governor defect
Failure repair		• Replace alternator governor device or alternator
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Check the circuit across A20.X10.14/7 and A4.X2.94/1 for open or short circuit. Check the circuit across A20.X10.14/10 and A4.X2.94/3 for open or short circuit. Check the circuit across A20.X10.14/9 and A4.X2.94/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A20 (SAM) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

158-1: Signal Range Check (SRC) for 'Battery voltage' reports LOW.

Generation condition		[Test Condition] • Continuously excepted when ECM is in pre drive mode (test phase immediately after ECM ignition) or monitoring is inhibited by FId_BattUSRC set by another failure.
		[Fault Detection] • The sensor raw signal BattU_uRaw (voltage) is below 768.00mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing		• The sensor raw signal BattU_uRaw (voltage) is equal to or above 768.00mV.
System reaction		• The sensed battery voltage value is used. • Further reactions according FID (see FID's)
		• 1) FId / Detected battery voltage error (via CAN) • 2) FId / The glow plug and the glow plug control lamp are switched off • 3) FId / Calibration of Lambda Sensor disabled due to invalid Voltage Signal on CJ125 Power stage • 4) FId / The Difference Check between several Lambda Sensors is disabled • 5) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 6) FId / Electrical Open Load Check of Lambda Sensor disabled • 7) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 8) FId / Use of the battery voltage for the range check of particulate filter (DPF) is inhibited • 9) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure)
Failure cause		• Battery defect, alternator defect, wiring problems (too high resistance) or ECU defect. Occurrence possible during cold start.
Failure repair		• Replace battery or alternator. Check ECU and wiring.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Check the circuit across A20.X10.14/7 and A4.X2.94/1 for open or short circuit. Check the circuit across A20.X10.14/10 and A4.X2.94/3 for open or short circuit. Check the circuit across A20.X10.14/9 and A4.X2.94/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A20 (SAM) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed

Inspection procedure	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

171-0: Signal Range Check (SRC) for 'Ambient temperature' reports HIGH.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • The sensed raw voltage value EnvT_uRaw is above 4.93V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensed raw voltage value EnvT_uRaw is less than 4.93V
System reaction		• Env.temperature is frozen at last valid value on preliminary failure and ramps to fixed replacement value 19.96°C {67.93°F} if failure is validated using slope 10.00K/s or 10.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) FId / Enable Shut-off conditioning in case of high environment temperature (engine overheating) or environmental temperature sensor is out of range • 2) FId / Inhibit Charged Air Cooler monitoring • 3) FId / Inhibit OxiCat passive monitor • 4) FId / Inhibit temperature sampling • 5) FId / Replacement value for start temperatures is used for modelling • 6) FId / Inhibit the Environment temperature plausibility check • 7) FId / Default value for Environmental temperature used • 8) FId / Coolant thermostat diagnosis disabled • 9) FId / Measured Environmental temperature for Coolant Thermostat diagnosis not usable (only modelled temp) • 10) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 11) Fid / Ambient temperature not considered for engine start temperature evaluation • 12) FId / Environmental temperature is frozen at last valid value • 13) FId / Environmental temperature replacement value is used • 14) Fid / Classification and duration of Environmental temperature for Trip recorder inhibited • 15) FId / The Adaptation of lambda Sensor disabled • 16) FId / The Difference Check between several Lambda Sensors is disabled • 17) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 18) FId / Electrical Open Load Check of Lambda Sensor disabled • 19) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 20) FId / Pressure Compensation of O2-Signal can not be learnt - is taken from the curve (LSU_facPresComLean_CUR) • 21) FId / Use of the induction air temperature for the range check of particulate filter (DPF) is inhibited • 22) FId / Freeze the value of Exh_pPFltUs in case of a preliminary defect. • 23) FId / Fuel driven engine coolant heater switched off • 24) FId / Inhibit Physical Range Check of environmental temperature sensor • 25) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• Sensor defective or short circuit in wiring to external source
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B27 (Humidity and temperature sensor “Intake air”). Check the circuit across B27.4/3 and A4.X2.94/24 for open or short circuit. Check the circuit across B27.4/4 and A4.X2.94/58 for open or short circuit. Check the circuit across B27.4/2 and A4.X2.94/34 for open or short circuit. Check the circuit across B27.4/1 and A4.X2.94/68 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B27 (Humidity and temperature sensor “Intake air”)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

171-1: Signal Range Check (SRC) for ‘Ambient temperature’ reports LOW.

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • The sensed raw voltage value EnvT_uRaw is less than 322.60mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensed raw voltage value EnvT_uRaw is above 322.60mV

https://truckmanualshub.com/

System reaction		• Env.temperature is frozen at last valid value on preliminary failure and ramps to fixed replacement value 19.96°C {67.93°F} if failure is validated using slope 10.00K/s or 10.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)

171-7: Component 'Environment sensor' has a plausibility error.Mechanical system not responding or out of adjustment

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • The function is not inhibited by another failure (FId_EnvTAmbTempMon is not set) • The vehicle speed VehV_v exceeds the threshold 40km/h {24.86mph} • The air mass flow AFS_dm exceeds the threshold 100.00Kg/h • The air temperature in HFM Air_tAFS is <49.96°C {121.93°F} and >-3549.94°C {-6357.89°F} OR the current selected air temperature EnvT_tEnvSel_mp <49.96°C {121.93°F} and >-3549.94°C {-6357.89°F}
		[Fault Detection] • If the absolute difference between the Air Mass Flow temperature Air_tAFS and Environment Temperature EnvT_tAir_mp exceeds 20.00K
		[Defect Debouncing] • Defect condition exceeded cumulatively > 30.00s • Failure is detected if active for 50% of the time
Fault healing		• Temperature difference in range
System reaction		• None Except FIDs
		• 1) FId / Inhibit Charged Air Cooler monitoring • 2) FId / Inhibit OxiCat passive monitor • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) FId / Inhibit Physical Range Check of environmental temperature sensor
Failure cause		• Environment Temperature sensor or Air Mass Flow Temperature deviating
Failure repair		• Check both sensors
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any diagnosis code is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B27 (Humidity and temperature sensor “Intake air”). Check the circuit across B27.4/3 and A4.X2.94/24 for open or short circuit. Check the circuit across B27.4/4 and A4.X2.94/58 for open or short circuit. Check the circuit across B27.4/2 and A4.X2.94/34 for open or short circuit. Check the circuit across B27.4/1 and A4.X2.94/68 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B27 (Humidity and temperature sensor “Intake air”)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

171-16: The current value for the ‘Ambient temperature’ component is too low.

Generation condition	[Test Condition] • Continuously if ADC module does not report an error for the sensor.
	[Fault Detection] • The sensed sensor signal for environmental temperature EnvT_tSens is above 99.96°C {211.93°F}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensed sensor signal for environmental temperature EnvT_tSens is below 99.96°C {211.93°F}

https://truckmanualshub.com/

		• Env.temperature is frozen at last valid value on preliminary failure and ramps to fixed replacement value 19.96°C {67.93°F} if failure is validated using slope 10.00K/s or 10.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
System reaction		• 1) FId / Environmental temperature is frozen at last valid value • 2) FId / Environmental temperature replacement value is used • 3) FId / Environmental temperature is frozen at last valid value • 4) FId / Environmental temperature replacement value is used • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / Inhibit the Environment temperature plausibility check • 7) FId / Inhibit Charged Air Cooler monitoring • 8) FId / Calculation of Turbocharger Compressor Temperature inhibited • 9) FId / Inhibit OxiCat passive monitor
Failure cause		• Environment temperature sensor defective
Failure repair		• Check or replace temperature sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B27 (Humidity and temperature sensor "Intake air"). Check the circuit across B27.4/1 and A4.X2.94/24 for open or short circuit. Check the circuit across B27.4/2 and A4.X2.94/58 for open or short circuit. Check the circuit across B27.4/4 and A4.X2.94/34 for open or short circuit. Check the circuit across B27.4/3 and A4.X2.94/68 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B27 (Humidity and temperature sensor "Intake air")". Reinstall all the removed connectors. Turn the starter switch in ON. Perform learning of B27 (Humidity and temperature sensor "Intake air") which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

172-0: Signal Range Check (SRC) for 'Intake air temperature' reports HIGH.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The sensed raw voltage value Air_uRawTIntkVUs is above 4.94V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 25% of the time
Fault healing		• The sensed raw voltage value Air_uRawTIntkVUs is below 4.94V
System reaction		• Temperature ramps to fixed replacement value 29.96°C {85.93°F} using slope 10.00K/s or 10.00K/s depending on whether the replacement value is above or below the current value
		• 1) FId / Replacement value for start temperatures is used for modelling • 2) FId / Reciprocal lambda signal replaced by substitute value for modelling • 3) FId / Fix substitution value (FEh) of Boost temperature transmit to CAN Message INCON (Inlet/Exhaust condition) • 4) Fid / Boost temperature not considered for engine start temperature evaluation • 5) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 6) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 7) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 8) FId / Use of the induction air temperature for the range check of particulate filter (DPF) is inhibited • 9) FId / Freeze the value of Exh_pPFltUs in case of a preliminary defect. • 10) FId / Freeze air intake temperature if preliminary failure is detected • 11) FId / Replace air intake temperature with default value if failure is vaildated • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Detection of cooled down combustion chamber for Zero Fuel Calibration(ZFC) disabled • 14) FId / Inhibit temperature sampling • 15) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B19 (Pressure and temperature sensor Turbocharger). Check the circuit across B19.4/3 and A4.X1.60/25 for open or short circuit. Check the circuit across B19.4/2 and A4.X1.60/12 for open or short circuit. Check the circuit across B19.4/4 and A4.X1.60/13 for open or short circuit. Check the circuit across B19.4/1 and A4.X1.60/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B19 (Pressure and temperature sensor Turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Perform learning of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

172-1: Signal Range Check (SRC) for ‘Intake air temperature’ reports LOW.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • The sensed raw voltage value Air_uRawTIntkVUs is less than 295.60mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 25% of the time
Fault healing	• The sensed raw voltage value Air_uRawTIntkVUs is above 295.60mV

https://truckmanualshub.com/

System reaction		• Temperature ramps to fixed replacement value 29.96°C {85.93°F} using slope 10.00K/s or 10.00K/s depending on whether the replacement value is above or below the current value
		• 1) FId / Replacement value for start temperatures is used for modelling • 2) FId / Reciprocal lambda signal replaced by substitute value for modelling • 3) FId / Fix substitution value (FEh) of Boost temperature transmit to CAN Message INCON (Inlet/Exhaust condition) • 4) Fid / Boost temperature not considered for engine start temperature evaluation • 5) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 6) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 7) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 8) FId / Use of the induction air temperature for the range check of particulate filter (DPF) is inhibited • 9) FId / Freeze the value of Exh_pPFltUs in case of a preliminary defect. • 10) FId / Freeze air intake temperature if preliminary failure is detected • 11) FId / Replace air intake temperature with default value if failure is vaildated • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Detection of cooled down combustion chamber for Zero Fuel Calibration(ZFC) disabled • 14) FId / Inhibit temperature sampling • 15) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 16) FId / Status of function identifier FId_EngDemTrqLimErr1 • 17) FId / Torque limitation 2 activated for power reduction • 18) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B19 (Pressure and temperature sensor Turbocharger). Check the circuit across B19.4/3 and A4.X1.60/25 for open or short circuit. Check the circuit across B19.4/2 and A4.X1.60/12 for open or short circuit. Check the circuit across B19.4/4 and A4.X1.60/13 for open or short circuit. Check the circuit across B19.4/1 and A4.X1.60/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B19 (Pressure and temperature sensor Turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Perform learning of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

172-2: More than one inkate air temperature sensors have plausibility error.

Generation condition		[Test Condition] • Once in a driving cycle at ECM start if an engine cold start has been detected: • monitoring not inhibited by another failure (FId_AirTMonPlausCSOk not set) • engine speed = 0 • Engine OFF time > 5.00h
		[Fault Detection] • If more than one sensor is deviating and it cannot be clearly identified which one.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Temperature value measured for the considered sensor is plausible. Healing possible only at next plausible check (after ECM restart)
System reaction		• None except FIDs
		• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) FId / Inhibit plausibility check of EGR Cooler Temperature Downstream • 3) FId / Inhibit Charged Air Cooler monitoring • 4) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• More than one temperature sensor considered for enhanced plausibility check is drifted
Failure repair		• Check all involved temperature sensor
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

174-0: Signal Range Check (SRC) for 'Fuel temperature' reports HIGH.

Generation condition	[Test Condition] • Monitoring is active as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously
	[Fault Detection] • The sensor raw signal >4.94V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensor raw signal <4.94V.

https://truckmanualshub.com/

System reaction		• The fuel temperature ramps (with slope 15.00K/s (rising) or 15.00K/s (dropping) to still actual Fuel temperature if this is not inhibited by the FID_FuelTFlSys due to another failure, • else Coolant Temperature if this is not Inhibited by FID_FuelTCTS due to another failure, • else fixed default value 64.96°C {148.93°F} • Further reactions according FID (see FID's)
		• 1) Fid / Fuel temperature not considered for engine start temperature evaluation • 2) FId / Default value for fuel temperature transmited via CAN • 3) FId / The actual evaluated Fuel temperature can not be used for substitution • 4) FId / Freeze fuel Temperature if preliminary failure detected • 5) FId / The replacement value for fuel temperature is used • 6) FId / Pressure wave correction of cylinder specific fuel quantity (QWC) disabled (due to defective fuel Temp Sensor) • 7) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 8) FId / Fuel temperature plausibility error detected
Failure cause		• Sensor defective or short circuit to external source
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B26 (Fuel temperature sensor). Make a visual check on each connector. Measure the resistance between B26 (Fuel temperature sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "B26 (Fuel temperature sensor)". Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A4.X1.60/57 and X45.12/2 for open circuit. Check electrical line between pins A4.X1.60/54 and X45.12/1 for open circuit. Check electrical line between pins A4.X1.60/57 and X45.12/2 for short circuit to positive. Is any abnormality recognized? Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

174-1: Signal Range Check (SRC) for 'Fuel temperature' reports LOW.

Generation condition		[Test Condition] • Monitoring is active as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously
		[Fault Detection] • The sensor raw signal < 298.00mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensor raw signal > 298.00mV.
System reaction		• The fuel temperature ramps (with slope 15.00K/s (rising) or 15.00K/s (dropping) to still actual Fuel temperature if this is not inhibited by the FID_FuelTFlSys due to another failure, • else Coolant Temperature if this is not Inhibited by FID_FuelTCTS due to another failure, • else fixed default value 64.96°C {148.93°F} • Further reactions according FID (see FID's)
		• 1) Fid / Fuel temperature not considered for engine start temperature evaluation • 2) FId / Default value for fuel temperature transmited via CAN • 3) FId / The actual evaluated Fuel temperature can not be used for substitution • 4) FId / Freeze fuel Temperature if preliminary failure detected • 5) FId / The replacement value for fuel temperature is used • 6) FId / Pressure wave correction of cylinder specific fuel quantity (QWC) disabled (due to defective fuel Temp Sensor) • 7) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 8) FId / Fuel temperature plausibility error detected
Failure cause		• Sensor defective or short circuit to ground
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B26 (Fuel temperature sensor). Make a visual check on each connector. Measure the resistance between B26 (Fuel temperature sensor) and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "B26 (Fuel temperature sensor)". Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check harness between A4 (Combustion engine Control unit) and B26 (Fuel temperature sensor) for short-circuit to another line. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

174-2: Component 'Fuel temperature sensor' has a plausibility error.

Generation condition		[Test Condition] • Initial measured temperatures are frozen and evaluated if: • Engine off time > 5.00h. • Plausibility test not inhibited by FId set
		[Fault Detection] • Temperature difference > 150.00K at 100.00s OR Temperature difference > 150.00K at 100.00s and < 150.00K at 100.00s but no heater is active (AddHtr_stDet = 0) failure is detected • Temperature differences limits are applied in curves depending on engine OFF time.
		[Defect Debouncing] • Immediate
Fault healing		• Temperature difference is in range
System reaction		• None
Failure cause		• Fuel temperature sensor defective
Failure repair		• Check sensor
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

174-16: The fuel temperature is too high.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • The sensed sensor signal FuelT_tSens is above 99.96°C {211.93°F}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensed sensor signal FuelT_tSens is below 99.96°C {211.93°F}
System reaction	• The fuel temperature ramps (with slope 15.00K/s (rising) or 15.00K/s (dropping) to still actual Fuel temperature if this is not inhibited by the FID_FuelTFlSys due to another failure, • else Coolant Temperature if this is not inhibited by FID_FuelTCTS due to another failure, • else fixed default value 64.96°C {148.93°F} • Further reactions according FID (see FID's)
	• 1) FId / The Coolant Temperature can not be used for substitution of fuel temperature • 2) FId / The actual evaluated Fuel temperature can not be used for substitution • 3) FId / Freeze fuel Temperature if preliminary failure detected • 4) FId / The replacement value for fuel temperature is used • 5) FId / Fuel temperature plausibility error detected
Failure cause	• Fuel temperature sensor defective

https://truckmanualshub.com/

Failure repair		• Check or replace sensor
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

188-0: Engine speed exceeds the upper limit while HLSDem is active.

Generation condition		[Test Condition] • Following test conditions should be fulfilled: Error path not inhibited by FID, Engine in normal mode, Engine Temperature between 59.96°C {139.93°F} and 109.96°C {229.93°F}, HLS is currently active, Vehicle speed < 1km/h {0.62mph}, Torque demand from speed governor, Drive train is open grip < 0.01- and Engine speed > 50.00rpm • Monitoring is released: HLSDem_stMonRlsCon_mp is set
		[Fault Detection] • The maximum permitted limit HLSDem_nMonMax_mp for the engine speed Epm_nEng is exceeded. • Permitted speed is the minimum value between 1600.00rpm and idle speed increased by multiplied % factor 30.00%
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• The maximum permitted limit HLSDem_nMonMax_mp for the engine speed Epm_nEng is not exceeded.
System reaction		• None
Failure cause		• Injection system problem, injectors deviation
Failure repair		• Replace Injectors
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). Remove the connector of Y16 (Fuel injector 2). Remove the connector of Y17 (Fuel injector 3). Remove the connector of Y18 (Fuel injector 4). Check the circuit across Y15.2/1 and A4.X1.60/31 for open or short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Check the circuit across Y16.2/1 and A4.X1.60/17 for open or short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Check the circuit across Y17.2/1 and A4.X1.60/16 for open or short circuit. Check the circuit across Y17.2/2 and A4.X1.60/1 for open or short circuit. Check the circuit across Y18.2/1 and A4.X1.60/32 for open or short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

188-1: Engine speed falls below the lower limit while HLSDem is active.

Generation condition		[Test Condition] • Following test conditions should be fulfilled: Error path not inhibited by FID, Engine in normal mode, Engine Temperature between 59.96°C {139.93°F} and 109.96°C {229.93°F}, HLS is currently active, Vehicle speed < 1km/h {0.62mph}, Torque demand from speed governor, Drive train is open grip < 0.01- and Engine speed > 50.00rpm • Monitoring is released: HLSDem_stMonRlsCon_mp is set
		[Fault Detection] • The engine speed Epm_nEng is below the minimum permitted limit HLSDem_nMonMin_mp. • Permitted limit is the maximum value between 455.00rpm and idle speed set point decreased by % factor 30.00%
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• The engine speed Epm_nEng is above the minimum permitted limit HLSDem_nMonMin_mp.
System reaction		• None
Failure cause		• Injection system problem, injectors deviation
Failure repair		• Replace Injectors
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). Remove the connector of Y16 (Fuel injector 2). Remove the connector of Y17 (Fuel injector 3). Remove the connector of Y18 (Fuel injector 4). Check the circuit across Y15.2/1 and A4.X1.60/31 for open or short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Check the circuit across Y16.2/1 and A4.X1.60/17 for open or short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Check the circuit across Y17.2/1 and A4.X1.60/16 for open or short circuit. Check the circuit across Y17.2/2 and A4.X1.60/1 for open or short circuit. Check the circuit across Y18.2/1 and A4.X1.60/32 for open or short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

190-3: Short circuit to battery error on the engine speed output power stage

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is active.
		[Fault Detection] • Hardware reports a short circuit to battery (SCB) error on the power stage for PWM output of engine speed.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1000.00ms. Failure healed, if the power stage does not report an Short Circuit to Battery error.
System reaction		• The power stage is shut-off.
Failure cause		• Short circuit of wiring to external source or defective engine speed limiter
Failure repair		• Check of wiring or replace tachometer
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B22 (Rpm sensor Combustion engine). Make a visual check on each connector. Measure the resistance between B22 (Rpm sensor Combustion engine) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B22 (Rpm sensor Combustion engine)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A4.X1.60/22 and B22.2/2 for open circuit. Check electrical line between pins A4.X1.60/7 and B22.2/1 for open circuit. Check electrical line between pins A4.X1.60/22 and B22.2/2 for short circuit to positive. Is any abnormality recognized? Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

190-4: Short circuit to ground error on the engine speed output power stage

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
		[Fault Detection] • Hardware reports a short circuit to ground error on the PWM output power stage for the engine speed signal.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Hardware does not report a short circuit to ground error on the PWM output power stage for the engine speed signal.
System reaction		• The power stage is shut-off.
Failure cause		• Short circuit of wiring to ground or defective tachometer
Failure repair		• Check of wiring or replace tachometer
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B22 (Rpm sensor Combustion engine). Make a visual check on each connector. Measure the resistance between B22 (Rpm sensor Combustion engine) and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B22 (Rpm sensor Combustion engine)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check harness between A4 (Combustion engine Control unit) and B22 (Rpm sensor Combustion engine) for short-circuit to another line. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

190-5: No load error on the engine speed output power stage

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
		[Fault Detection] • Hardware reports a “open load” (OL) error on the PWM output power stage for the Engine Speed.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Hardware does not report a “open load” (OL) error.on the PWM output power stage for the Engine Speed.
System reaction		• The power stage is shut-off.
Failure cause		• Broken or disconnected wiring or defective tachometer
Failure repair		• Check of wiring or replace tachometer
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B22 (Rpm sensor Combustion engine). Make a visual check on each connector. Measure the resistance between B22 (Rpm sensor Combustion engine) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B22 (Rpm sensor Combustion engine)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A4.X1.60/22 and B22.2/2 for open circuit. Check electrical line between pins A4.X1.60/7 and B22.2/1 for open circuit. Check electrical line between pins A4.X1.60/22 and B22.2/2 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

190-12: Component ‘Engine speed as PWM signal’ has overtemperature.Bad intelligent device or component

Generation condition		[Test Condition] • Monitoring only when the power stage is active.
		[Fault Detection] • The hardware reports an over temperature (OT) error on the PWM output power stage for the Engine Speed.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 550.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 3.00s. Failure healed, if the power stage does not report an OT error.
System reaction		• The power stage is shut-off.
Failure cause		• High battery voltage, high load and high ECU temperature, defective wiring, Tachometer or ECU
Failure repair		• Check load and output, check wiring, replace Tachometer or ECU
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B22 (Rpm sensor Combustion engine). Make a visual check on each connector. Measure the resistance between B22 (Rpm sensor Combustion engine) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B22 (Rpm sensor Combustion engine)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A4.X1.60/22 and B22.2/2 for open circuit. Check electrical line between pins A4.X1.60/7 and B22.2/1 for open circuit. Check electrical line between pins A4.X1.60/22 and B22.2/2 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

251-2: External clock needs manually reset (summer/winter or time zone changed)

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn’t running yet, while the engine isn’t cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Once at ECU start
		[Fault Detection] • The time received via CAN < ECU absolute time,
		[Defect Debouncing] • Defect condition fulfilled continuously >1000.0 ms
Fault healing		• The time received via CAN >= ecu absolute time,
System reaction		• None except FIDs
		• 1) FId / Plausibilty check of temperature sensors at cold start not allowed • 2) FId / Inhibit temperature sampling • 3) FId / Inhibit plaus.check engine coolant temperature at cold start • 4) FId / Fuel temperature plausibility error detected • 5) FId / Inhibit plausibility check of EGR Cooler Temperature Downstream • 6) FId / Status of function identifier FID_UHCWrmStrtChk; Status des Funktions Identifiers FID_UHCWrmStrtChk
Failure cause		• Summer/winter time change or another time zone was entered
Failure repair		• No intervention necessary
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

251-12: External clock (tachograph)is defect.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Once per cycle at ECM on
		[Fault Detection] • Difference between the absolute ECU internal time and the external CAN time is outside of applicable range for at least 5.00- times (tested every 100.00s)
		[Defect Debouncing] • Immediate
Fault healing		• Difference between the absolute ECU internal time and the external CAN time is inside of applicable range for at least 5.00- times (tested every 100.00s). • Healing not possible in same cycle, only at next ECU ON.
System reaction		• None except FIDs
		• 1) FId / Plausibilty check of temperature sensors at cold start not allowed • 2) FId / Inhibit temperature sampling • 3) FId / Inhibit plaus.check engine coolant temperature at cold start • 4) FId / Fuel temperature plausibility error detected • 5) FId / Inhibit plausibility check of EGR Cooler Temperature Downstream • 6) FId / Status of function identifier FID_UHCWrmStrtChk; Status des Funktions Identifiers FID_UHCWrmStrtChk
Failure cause		• Defective external clock (Tachhograf)
Failure repair		• Check and replace tachograf
	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with A11 (Meter cluster) is generated, make a system diagnosis according to the diagnosis code. Go to step2
Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of A11 (Meter cluster). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A11 (Meter cluster). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

354-0: Signal value from Intake Air humidity Sensor above maximum limit

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring not inhibited by FID_SSMonIndAH due to another failure. • Engine running since start > 8.00min • Engine temperature > 39.96°C {103.93°F} • SCR Dosing System ready for DEF Injection (including SCR temp > 299.96°C {571.93°F})
	[Fault Detection] • The Sensor Signal > 3.80V
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms

https://truckmanualshub.com/

Fault healing		• The Sensor Signal < 3.80V
System reaction		• According FID (see FID's) • Very Probably also Information Failure "IndAHSRCMax" stored and active. • Air humidity is frozen at last valid value on preliminary failure and ramps to fixed replacement value 50.00% if failure is validated using slope 3.00%/s or 3.00%/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) FId / inhibited in case of Temporary defect associated with sensor, when the sensed value is from Hardware • 2) FId / inhibited in case of Permanent defect associated with sensor, when the sensed value is from Hardware • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) FId / Air Humidity Sensor permanent Physical Range Check errors
Failure cause		• Sensor full with water droplets • Sensor defective or short circuit to external source
Failure repair		• Clean Sensor (dry it) • Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B27 (Humidity and temperature sensor "Intake air"). Check the circuit across B27.4/3 and A4.X2.94/24 for open or short circuit. Check the circuit across B27.4/4 and A4.X2.94/58 for open or short circuit. Check the circuit across B27.4/2 and A4.X2.94/34 for open or short circuit. Check the circuit across B27.4/1 and A4.X2.94/68 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B27 (Humidity and temperature sensor "Intake air")". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

354-16: Probably water droplets on Intake Air humidity Sensor.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously, if no sensor supply error is detected.
		[Fault Detection] • The sensed raw voltage value IndAH_uRaw > 3.80V
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• The sensed raw voltage value IndAH_uRaw < 3.80V
System reaction		• Possibly also failure “IndAHSRCMaxDly” active --> in this case please proceed according that failure. • Air humidity is frozen at last valid value on preliminary failure and ramps to fixed replacement value 50.00% if failure is validated using slope 3.00%/s or 3.00%/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID’s)
		• 1) FId / inhibited in case of Temporary defect associated with sensor, when the sensed value is from Hardware • 2) FId / inhibited in case of Permanent defect associated with sensor, when the sensed value is from Hardware • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) FId / Air Humidity Sensor permanent Physical Range Check errors
Failure cause		• Sensor full with water droplets or • Sensor defective or short circuit to external source
Failure repair		• NO action needed as long as the failure IndAHSRCMaxDly is not active. • If failure IndAHSRCMaxDly is not active, check duration of failure active: If a single duration lasts longer than ~10 min --> there is probably an electrical failure. --> Check wiring or replace sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any diagnosis code is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B27 (Humidity and temperature sensor “Intake air”). Check the circuit across B27.4/3 and A4.X2.94/24 for open or short circuit. Check the circuit across B27.4/4 and A4.X2.94/58 for open or short circuit. Check the circuit across B27.4/2 and A4.X2.94/34 for open or short circuit. Check the circuit across B27.4/1 and A4.X2.94/68 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B27 (Humidity and temperature sensor “Intake air”)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

354-17: Signal Range Check (SRC) for 'Air humidity sensor' reports LOW.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously if no ADC failure is detected
		[Fault Detection] • The sensed sensor signal IndAH_rLin is less than -3.00%
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• Physical signal is in plausible range
System reaction		• Induction Air Humidity is frozen at last valid value on preliminary failure and ramps to fixed replacement value 50.00% if failure is validated using slope 3.00%/s or 3.00%/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Inaccurate or defective Induction Air Humidity sensor, or defect in its wiring
Failure repair		• Check wiring and the accuracy of Induction Air Humidity sensor and replace it if necessary
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B27 (Humidity and temperature sensor "Intake air"). Check the circuit across B27.4/1 and A4.X2.94/24 for open or short circuit. Check the circuit across B27.4/2 and A4.X2.94/58 for open or short circuit. Check the circuit across B27.4/4 and A4.X2.94/34 for open or short circuit. Check the circuit across B27.4/3 and A4.X2.94/68 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B27 (Humidity and temperature sensor “Intake air”)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform learning of B27 (Humidity and temperature sensor “Intake air”) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

354-18: Signal Range Check (SRC) for ‘Induction Air Humidity’ reports LOW.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously, if no sensor supply error is detected.
		[Fault Detection] • The sensed raw voltage value IndAH_uRaw < 600.00mV
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• The sensed raw voltage value IndAH_uRaw > 600.00mV
System reaction		• Air humidity is frozen at last valid value on preliminary failure and ramps to fixed replacement value 50.00% if failure is validated using slope 3.00%/s or 3.00%/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID’s)
		• 1) FId / inhibited in case of Temporary defect associated with sensor, when the sensed value is from Hardware • 2) FId / inhibited in case of Permanent defect associated with sensor, when the sensed value is from Hardware • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) FId / Air Humidity Sensor permanent Physical Range Check errors
Failure cause		• Short circuit of wiring to ground or defective sensor
Failure repair		• Check wiring and sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B27 (Humidity and temperature sensor “Intake air”). Check the circuit across B27.4/3 and A4.X2.94/24 for open or short circuit. Check the circuit across B27.4/4 and A4.X2.94/58 for open or short circuit. Check the circuit across B27.4/2 and A4.X2.94/34 for open or short circuit. Check the circuit across B27.4/1 and A4.X2.94/68 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B27 (Humidity and temperature sensor “Intake air”)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

354-31: Component ‘Air humidity sensor’ has a plausibility error.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Plausibility check not inhibited by another failure (Fid_IndAHPlaus not set) • vehicle speed VehV_v > -1.00km/h • change in temperature IndAH_dtOut_mp between 0.04°C {32.07°F}/s and 0.04°C {32.07°F}/s
	[Fault Detection] • If the change in relative humidity IndAH_drOut_mp is below 0.01%/s
	[Defect Debouncing] • Defect condition fulfilled continuously >10.0 ms
Fault healing	• If the change in relative humidity IndAH_drOut_mp is above 0.01%/s
System reaction	• None except FIDs
	• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) FId / Air Humidity Sensor permanent Physical Range Check errors
Failure cause	• Humidity sensor dynamic compromised, value sticking
Failure repair	• Check and replace humidity sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B27 (Humidity and temperature sensor “Intake air”). Check the circuit across B27.4/1 and A4.X2.94/24 for open or short circuit. Check the circuit across B27.4/2 and A4.X2.94/58 for open or short circuit. Check the circuit across B27.4/4 and A4.X2.94/34 for open or short circuit. Check the circuit across B27.4/3 and A4.X2.94/68 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B27 (Humidity and temperature sensor “Intake air”)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform learning of B27 (Humidity and temperature sensor “Intake air”) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

355-31: DPF Lube Oil monitoring: Critical time for oil dilution exceeded

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • If the cumulative duration of particulate filter regeneration phases which causes oil dilution exceeds the maximum duration of 1.58d, the error for critical oil dilution time is detected.
	[Defect Debouncing] • None
Fault healing	• An independent healing is not possible. Once the oil has been changed, OilLft_tiRgnOilDil is set to ZERO using the dedicated UDS service “Routine Control ID =$245” for resetting the oil monitoring integrator.
System reaction	• Particulate Filter Regeneration measures are suppressed.
	• 1) FId / Particulate filter ((DPF) Regeneration inhibited
Failure cause	• Excessive engine running time under oil dilution conditions, due to retarded post injection for filter regeneration.

https://truckmanualshub.com/

Failure repair		• Replace engine oil and reset timer for oil dilution with tester using the dedicated UDS service “Routine Control ID =$245”
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Replace component “Engine oil”. Perform the learned value resetting procedure of Engine oil which A4 (Combustion engine Control unit) learns. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

412-0: Signal Range Check (SRC) for ‘Exhaust temperature downstream of exhaust gas recirculation cooler’ reports HIGH.

Generation condition		[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
		[Fault Detection] • The Sensed raw voltage value Air_uRawTEGRClrDs is above 1.48V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• The Sensed raw voltage value Air_uRawTEGRClrDs is below 1.48V
System reaction		• EGR cooler downstream temperature is frozen at last valid value on preliminary failure and ramps, using slope 3300.00K/s or 3300.00K/s depending whether the measured value is above or below replacement value, to a default value of 40.96°C {105.73°F} if failure is validated. • Further reactions according FID (see FID’s)
		• 1) FId / Inhibit EGR cooler efficiency monitoring • 2) FId / Inhibit EGR cooler bypass valve • 3) FId / Freeze EGR Cooler Temperature Downstream value if preliminary failure is detected • 4) FId / Inhibit Physical Range Check of EGR Cooler Temperature Downstream • 5) FId / Replace EGR Cooler Temperature Downstream with default value if failure is vaildated • 6) FId / Inhibit plausibility check of EGR Cooler Temperature Downstream
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X1.60/56 and B60.2/1 for open circuit. Check electrical line between pins A4.X1.60/21 and B60.2/2 for open circuit. Check electrical line between pins A4.X1.60/56 and B60.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B60 (EGR cooler outlet temperature sensor) for short-circuit to another line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B60 (EGR cooler outlet temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

412-1: Signal Range Check (SRC) for 'Exhaust temperature downstream of exhaust gas recirculation cooler' reports LOW.

Generation condition	[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
	[Fault Detection] • The Sensed raw voltage value Air_uRawTEGRClrDs is below 470.40mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The Sensed raw voltage value Air_uRawTEGRClrDs is above 470.40mV
System reaction	• EGR cooler downstream temperature is frozen at last valid value on preliminary failure and ramps, using slope 3300.00K/s or 3300.00K/s depending whether the measured value is above or below replacement value, to a default value of 40.96°C {105.73°F} if failure is validated. • Further reactions according FID (see FID's)
	• 1) FId / Inhibit EGR cooler efficiency monitoring • 2) FId / Inhibit EGR cooler bypass valve • 3) FId / Freeze EGR Cooler Temperature Downstream value if preliminary failure is detected • 4) FId / Inhibit Physical Range Check of EGR Cooler Temperature Downstream • 5) FId / Replace EGR Cooler Temperature Downstream with default value if failure is vaildated • 6) FId / Inhibit plausibility check of EGR Cooler Temperature Downstream
Failure cause	• Short circuit of sensor to ground or defective sensor
Failure repair	• Check wiring or replace sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X1.60/56 and B60.2/1 for open circuit. Check electrical line between pins A4.X1.60/21 and B60.2/2 for open circuit. Check electrical line between pins A4.X1.60/56 and B60.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B60 (EGR cooler outlet temperature sensor) for short-circuit to another line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B60 (EGR cooler outlet temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

412-2: Component ‘Exhaust temperature downstream of exhaust gas recirculation cooler’ has a plausibility error.

Generation condition	[Test Condition] • Initial measured temperatures are frozen and evaluated if: • Engine off time > 5.00h. • Plausibility test not inhibited (FId_TEGRClrDsVDPlaus not set)
	[Fault Detection] • Temperature difference > 300.00K at 50.00s OR Temperature difference > 300.00K at 50.00s and < 300.00K at 50.00s but no heater is active (AddHtr_stDet = 0) failure is detected
	[Defect Debouncing] • Immediate
Fault healing	• Temperature difference is in range
System reaction	• None except FIDs
	• 1) FId / Inhibit EGR cooler efficiency monitoring
Failure cause	• EGR cooler downstream temperature sensor defective
Failure repair	• Check sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X1.60/56 and B60.2/1 for open circuit. Check electrical line between pins A4.X1.60/21 and B60.2/2 for open circuit. Check electrical line between pins A4.X1.60/56 and B60.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B60 (EGR cooler outlet temperature sensor) for short-circuit to another line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B23 (Temperature sensor Exhaust system 1)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B60 (EGR cooler outlet temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

412-16: Component ‘Temperature sensor ‘Exhaust gas recirculation’’ is thermally overloaded.

Generation condition	[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
	[Fault Detection] • The sensed sensor signal Air_tSensTEGRClrDs is above 749.96°C {1381.93°F}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensed sensor signal Air_tSensTEGRClrDs is below 749.96°C {1381.93°F}

https://truckmanualshub.com/

System reaction		• EGR cooler downstream temperature is frozen at last valid value on preliminary failure and ramps, using slope 3300.00K/s or 3300.00K/s depending whether the measured value is above or below replacement value, to a default value of 40.96°C {105.73°F} if failure is validated. • Further reactions according FID (see FID's)
		• 1) FId / Freeze EGR Cooler Temperature Downstream value if preliminary failure is detected • 2) FId / Replace EGR Cooler Temperature Downstream with default value if failure is vaildated • 3) FId / Inhibit EGR cooler efficiency monitoring
Failure cause		• Inaccurate or defective EGR cooler downstream temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the EGR cooler downstream temperature sensor and replace it if necessary
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X1.60/56 and B60.2/1 for open circuit. Check electrical line between pins A4.X1.60/21 and B60.2/2 for open circuit. Check electrical line between pins A4.X1.60/56 and B60.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B60 (EGR cooler outlet temperature sensor) for short-circuit to another line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "B60 (EGR cooler outlet temperature sensor)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

521-2: Signal error for Brake detected via CAN

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this t
	[Fault Detection] • CAN Message value = 0
	[Defect Debouncing] • infinite
Fault healing	• CAN Message Value >0
System reaction	• If an error is detected the cruise control can not be activated. • Further reactions according FID (see FID)
	• 1) FId / Brake status message to CAN: Break defective • 2) FId / Underbraking disabled for High and Low engine speed control (HLS) (no special control parameters in case of Underbraking used) • 3) FId / Single Injector shut off test inhibited • 4) FId / Run Up
Failure cause	• One of the brake switches has a short circuit. • The circuit has an open lead.
Failure repair	• Check the brake switches for short circuit • Check the wiring and the brake switches for open lead

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check to see if S35 (Brake light Switches) is fully operational. Check the circuit across S35 (Brake light Switches) and A20 (SAM) for open or short circuit. For procedures, refer to the Shop Manual. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

https://truckmanualshub.com/

521-12: Main and redundant brake switch state are different.

Generation condition		[Test Condition] • Continuously, if the redundant brake contact is used and terminal 15 is on.
		[Fault Detection] • If the main brake contact Brk_stMn and the redundant brake contact Brk_stRed are not in the same state.
		[Defect Debouncing] • Defect condition fulfilled continuously > 30000.0 ms
Fault healing		• If the main brake contact and the redundant brake contact are in “brake” state.
System reaction		• If an error is detected the cruise control can not be activated. • Further reactions according FID (see FID)
		• 1) FId / Brake status message to CAN: Break defective • 2) FId / Underbraking disabled for High and Low engine speed control (HLS) (no special control parameters in case of Underbraking used) • 3) FId / Single Injector shut off test inhibited • 4) FId / Run Up test inhibited • 5) FId / Actuator test for Metering Unit (MeUn) of Common Rail disabled • 6) FId / Set point test of Metering Unit (MeUn) of Common Rail disabled • 7) FId / Substitute reaction: violation of a running condition and the pcv test will not be executed • 8) FId / Fuel rail pressure control valve (PCV) set point test inhibited • 9) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 10) FId / High pressure test inhibited • 11) FId / Rail Pressure set point test inhibited • 12) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 13) Fid / Cruise control immediately shut off
Failure cause		• The adjustment of the brake switches is not good enough. • One of the brake switches has a short circuit. • The circuit has an open lead.
Failure repair		• Check the adjustment of the brake switches • Check the brake switches for short circuit • Check the wiring and the brake switches for open lead
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check to see if S35 (Brake light Switches) is fully operational. Check the circuit across S35 (Brake light Switches) and A20 (SAM) for open or short circuit. For procedures, refer to the Shop Manual. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

595-2: Irreversible fault path which indicates the invalid combination of cruise control keys pressed

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • 2 Buttons pressed together (possible combinations): Resume + Down, Resume + Up and Up and Down
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing	• No Healing possible (irreversible failure)
System reaction	• Cruise control goes in mode "off" • Further reactions according FID (see FID's)
	• 1) FId / Cruise control unit goes into error state as long as the "switch off" button not active
Failure cause	• Failure in Cruise control module (switches) • Failure in wiring harness
Failure repair	• Check Cruise control unit • Check wiring harness

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. For procedures, refer to the Shop Manual. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step6
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

https://truckmanualshub.com/

595-31: Reversible fault path which indicates the invalid combination of cruise control keys pressed

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • One or more switches active for longer than 60.00s Down, Up and Resume
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing		• Cruise control request "logic"
System reaction		• Cruise control goes in mode "off" • Further reactions according FID (see FID's)
		• 1) FId / Cruise control unit goes into error state as long as the "switch off" button not active
Failure cause		• Failure in Cruise control module (switches) • Failure in wiring harness
Failure repair		• Check Cruise control unit • Check wiring harness
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. For procedures, refer to the Shop Manual. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step6
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

598-2: Signal Error for Clutch pedal.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • If the clutch signal received by CAN reports a clutch defect (Com_stClth == 128, Bit 7 set).
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• If the clutch signal received by CAN does not report a clutch defect (Bit 7 of Com_stClth <128).
System reaction	• If a final error is detected or if error healing is active, the value of the output signal Clth_st is equal to the default value 128.00-. • Cruise Control cannot be activated
	• 1) FId / Replacement value for clutch state used, value via CAN defective • 2) Fid / Cruise control immediately shut off • 3) FId / Underbraking disabled for High and Low engine speed control (HLS) (no special control parameters in case of Underbraking used) • 4) FId / Single Injector shut off test inhibited • 5) FId / Run Up test inhibited • 6) FId / Actuator test for Metering Unit (MeUn) of Common Rail disabled • 7) FId / Set point test of Metering Unit (MeUn) of Common Rail disabled • 8) FId / Substitute reaction: violation of a running condition and the pcv test will not be executed • 9) FId / Fuel rail pressure control valve (PCV) set point test inhibited • 10) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 11) FId / High pressure test inhibited • 12) FId / Rail Pressure set point test inhibited • 13) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 14) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 15) FId / Misfire Detection disabled
Failure cause	• Clutch switch defective or problem on CAN communication with cutch switch
Failure repair	• Check clutch switch. Check CAN connection

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

604-2: Plausibility error of neutral status signal of gear box

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Test is executed during after-run (Key 15 off)
		[Fault Detection] • Failure is detected if the vehicle speed during current driving cycle was > 80km/h {49.71mph} at least once and the total number of transitions in neutral status since system start is not > 1.00- at the end of driving cycle (Key 15 off)
		[Defect Debouncing] • Immediate.
Fault healing		• When the system detects more than 1.00- transitions in neutral state during a driving cycle after failed driving cycle.
System reaction		• None
Failure cause		• If the driver drive off, the vehicle speed get upper than 80km/h {49.71mph}, and he had not change the gear for more than 1.00- times (e.g. starting in 3rd gear downhilll). • The gearbox neutral position switch is defective.
Failure repair		• Driver mistake (no action required) (probability high if duration of failed driving cycle short) • Check the gearbox neutral position switch.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

606-0: Overspeed of component 'engine protection' has occurred.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Engine speed exceeds threshold 4250.00rpm
		[Defect Debouncing] • Defect condition exceeded cumulatively > 3.00s • Failure is detected if active for 50% of the time
Fault healing		• Engine speed falls below threshold 4250.00rpm
System reaction		• None (an intervention in the engine shut-off coordinator would be critical)
Failure cause		• Engine overspeed has occurred
Failure repair		• No reactions necessary only if this fault/information status reoccurs frequently. In this case check driving conditions of vehicle, engine speed acquisition and injection system for quantity set point and actual value during fault recognition, check also for ECM errors.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

636-2: Crankshaft signal disturbance from engine speed sensor.Data erratic, intermittent or incorrect

Generation condition		[Test Condition] • Continuously if engine is running and speed > 650.00rpm and FId_EpmCrSDiag not set by another failure (diagnostic inhibited)
		[Fault Detection] • A disturbed crankshaft signal exists if the number of signal plausibility errors EpmCrS_ctErrSig reaches the threshold 80.00-.
		[Defect Debouncing] • Immediate
Fault healing		• No healing possible if limp home functionality activated. • Every crankshaft rotation without disturbances the counter EpmCrS_ctErrSig is decremented starting from 80.00-. The same time the healing counter EpmCrS_ctRevWaitDiag is decremented starting from 2.00-. If both counters reach zero, the error is healed.
System reaction		• With disturbed Crankshaft signal the engine speed is calculated with help of the camshaft speed signal. • The limp home with defect crankshaft is active, the angle calculation and synchronisation is done solely via camshaft signal.
		• 1) FId / Active surge dampener disabled • 2) FId / Active surge dampener in mode 2 disabled • 3) FId / Actuator protection at engine stand still disabled • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 6) FId / Status of function identifier FId_EngDemTrqLimErr1 • 7) FId / Torque limitation 2 activated for power reduction • 8) FId / Camshaft position adaption (learning of real position to the theoretical one) inhibited • 9) FId / Camshaft offset diagnosis inhibited (due camshaft or crankshaft signal errors) • 10) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 11) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 12) FId / Analysis of engine starting problem disabled • 13) FId / Offset test of Rail pressure sensor disabled • 14) FId / Offset test of Rail pressure sensor only released, if this failure path is tested • 15) FId / Switching to a Replacement value for the steering pump base and dynamic torque • 16) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 17) FId / Electrical engine coolant heater switched off • 18) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 19) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 20) FId / Inhibit OxiCat passive monitor • 21) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 22) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• High vibration of crank shaft signal sensor • Intermittent open circuit of sensor • Electrical disturbances due to damaged isolation of wiring harness • Electrical disturbances due external electromagnetic disturbances
Failure repair		• Check if sensor fixed correctly (should not be moveable) • Check wiring harness and contacts • Check if electrical lines with high electric performance are additionally installed (components not validated by the vehicle manufacturer)
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

636-9: Crankshaft signal loss from engine speed sensor. Abnormal update rate

Generation condition	[Test Condition] • Continuously if engine is running and speed > 650.00rpm and Fld_EpmCrSDiag not set by another failure (diagnostic inhibited)
	[Fault Detection] • No crankshaft signal available for at least 2.00- camshaft revolutions. • Camshaft signal is tested and plausible.
	[Defect Debouncing] • Immediate
Fault healing	• No healing if limp home functionality is active • The healing is done as soon as Crankshaft gap is plausibly found.
System reaction	• With disturbed Crankshaft signal the engine speed is calculated with help of the camshaft speed signal. • The limp home with defect crankshaft is active, the angle calculation and synchronisation is done solely via camshaft signal.
	• 1) Fld / Active surge dampener disabled • 2) Fld / Active surge dampener in mode 2 disabled • 3) Fld / Actuator protection at engine stand still disabled • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 6) Fld / Status of function identifier Fld_EngDemTrqLimErr1 • 7) Fld / Torque limitation 2 activated for power reduction • 8) Fld / Camshaft position adaption (learning of real position to the theoretical one) inhibited • 9) Fld / Camshaft offset diagnosis inhibited (due camshaft or crankshaft signal errors) • 10) Fld / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 11) Fld / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 12) Fld / Analysis of engine starting problem disabled • 13) Fld / Offset test of Rail pressure sensor disabled • 14) Fld / Offset test of Rail pressure sensor only released, if this failure path is tested • 15) Fld / Switching to a Replacement value for the steering pump base and dynamic torque • 16) Fld / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 17) Fld / Electrical engine coolant heater switched off • 18) Fld / Zero Fuel Calibration (ZFC) of injectors disabled • 19) Fld / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 20) Fld / Inhibit OxiCat passive monitor • 21) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 22) Fld / Inhibit ISS, max number of engine starts exceeded
Failure cause	• Crank shaft speed sensor defect • Crank shaft speed sensor not mounted correctly • Crank shaft speed sensor not connected electrically, open circuit or short circuit.
Failure repair	• Check if crank shaft speed sensor mounted correctly • Check wiring harness to open/short circuit • Check crank shaft speed sensor for correct function and replace it if necessary

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B22 (Rpm sensor Combustion engine). Make a visual check on each connector. Measure the resistance between B22 (Rpm sensor Combustion engine) and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B22 (Rpm sensor Combustion engine)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check harness between A4 (Combustion engine Control unit) and B22 (Rpm sensor Combustion engine) for short-circuit to another line. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

651-3: The fuel injector of cylinder 1 has a short circuit.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • If the measured pattern for the injector evaluation of cylinder 1 is equal to applied behaviour bit pattern for short circuit detection.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

System reaction		• None except FIDs.
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 3) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 4) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 5) FId / Injector bank shut off • 6) FId / Nominal Voltage Calibration NVC of injectors disabled • 7) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 8) FId / Redundant Engine shut off path not tested due to error of an injector • 9) FId / Redundant Engine shut off path test inhibited • 10) FId / Inhibit DPF monitor • 11) FId / Particulate filter ((DPF) Regeneration inhibited • 12) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 13) FId / Particulate filter (DPF) regeneration not possible due to general system failure • 14) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 15) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 16) FId / Misfire Detection disabled • 17) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 18) FId / Inhibit OxiCat passive monitor
Failure cause		• Short circuit in wiring or injector
Failure repair		• Check wiring, replace fuel injector of cylinder 1.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). If corresponding fault codes are also present on other components, check the common power supply and common ground point “ for open circuit and short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y15 (Fuel injector 1)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Perform coding of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

651-5: The fuel injector (cylinder 1) has an electrical fault or an open circuit.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • If the measured pattern for the injector evaluation of cylinder 1 is equal to applied behaviour bit pattern for open load detection.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None except FIDs.
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 3) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 4) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 5) FId / Nominal Voltage Calibration NVC of injectors disabled • 6) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 7) FId / Redundant Engine shut off path not tested due to error of an injector • 8) FId / Redundant Engine shut off path test inhibited • 9) FId / Inhibit DPF monitor • 10) FId / Particulate filter ((DPF) Regeneration inhibited • 11) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) FId / Misfire Detection disabled • 15) FId / Inhibit OxiCat passive monitor • 16) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Open load for injector of cylinder 1 is detected.
Failure repair		• Check wiring, replace fuel injector of cylinder 1.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6

654-3: The fuel injector of cylinder 2 has a short circuit.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • If the measured pattern for the injector evaluation of cylinder 2 is equal to applied behaviour bit pattern for short circuit detection.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None except FIDs.
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 3) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 4) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 5) FId / Injector bank 1 shut off • 6) FId / Nominal Voltage Calibration NVC of injectors disabled • 7) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 8) FId / Redundant Engine shut off path not tested due to error of an injector • 9) FId / Redundant Engine shut off path test inhibited • 10) FId / Inhibit DPF monitor • 11) FId / Particulate filter ((DPF) Regeneration inhibited • 12) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 13) FId / Particulate filter (DPF) regeneration not possible due to general system failure • 14) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 15) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 16) FId / Misfire Detection disabled • 17) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 18) FId / Inhibit OxiCat passive monitor
Failure cause		• Short circuit in wiring or injector
Failure repair		• Check wiring, replace fuel injector of cylinder 2.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y16 (Fuel injector 2). If corresponding fault codes are also present on other components, check the common power supply and common ground point “ for open circuit and short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y16 (Fuel injector 2)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y16 (Fuel injector 2) which A4 (Combustion engine Control unit) learns. Perform coding of Y16 (Fuel injector 2) which A4 (Combustion engine Control unit) learns. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

654-5: The fuel injector (cylinder 2) has an electrical fault or an open circuit.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • If the measured pattern for the injector evaluation of cylinder 2 is equal to applied behaviour bit pattern for open load detection.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

		• None except FIDs.
System reaction		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 3) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 4) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 5) FId / Nominal Voltage Calibration NVC of injectors disabled • 6) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 7) FId / Redundant Engine shut off path not tested due to error of an injector • 8) FId / Redundant Engine shut off path test inhibited • 9) FId / Inhibit DPF monitor • 10) FId / Particulate filter ((DPF) Regeneration inhibited • 11) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) FId / Misfire Detection disabled • 15) FId / Inhibit OxiCat passive monitor • 16) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Open load for injector of cylinder 2 is detected.
Failure repair		• Check wiring, replace fuel injector of cylinder 2.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y16 (Fuel injector 2). If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y16 (Fuel injector 2)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y16 (Fuel injector 2) which A4 (Combustion engine Control unit) learns. Perform coding of Y16 (Fuel injector 2) which A4 (Combustion engine Control unit) learns. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

654-6: The fuel injector of cylinder 2 has a short circuit between positive and ground.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • If the measured pattern for the injector evaluation of cylinder 2 is equal to applied behaviour bit pattern for short circuit Highside/Lowside detection.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None except FIDs.
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 3) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 4) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 5) FId / Cylinder 4 (firing order) shut off • 6) FId / Nominal Voltage Calibration NVC of injectors disabled • 7) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 8) FId / Redundant Engine shut off path not tested due to error of an injector • 9) FId / Redundant Engine shut off path test inhibited • 10) FId / Inhibit DPF monitor • 11) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 12) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 13) FId / Misfire Detection disabled • 14) FId / Inhibit OxiCat passive monitor • 15) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Short circuit in wiring or injector
Failure repair		• Check wiring, replace fuel injector of cylinder 2.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y16 (Fuel injector 2). If corresponding fault codes are also present on other components, check the common power supply and common ground point “ for open circuit and short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y16 (Fuel injector 2)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y16 (Fuel injector 2) which A4 (Combustion engine Control unit) learns. Perform coding of Y16 (Fuel injector 2) which A4 (Combustion engine Control unit) learns. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

677-3: The starter relay has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Monitoring only when the power stage is inactive. • ECU not in after-run, Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
	[Fault Detection] • Hardware reports a Short Circuit to Battery error on HS power stage for the starter relay actuator.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 25% of the time
Fault healing	• Hardware does not report a Short Circuit to Battery error on HS power stage for the starter relay actuator.
System reaction	• Power stage shut off. • Further reactions according FID (see FID’s)
	• 1) FId / Physical errors that could be detected when the Starter is in the Running state • 2) FId / Physical errors that could be detected when the Starter is in the Stopped state • 3) FId / Status of function identifier FId_EngDemTrqLimErr1 • 4) FId / Torque limitation 2 activated for power reduction • 5) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 6) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause	• Short circuit of wiring to external source or defective HS starter relay
Failure repair	• Check of wiring or replacement of HS relay

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K21 (Safety relay). Check the circuit across A4.X2.94/91 and K21.5/3 for open or short circuit. Check the circuit across A4.X2.94/69 and K21.5/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “K21 (Safety relay)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X16 (Intermediate connector). Check the circuit across A4.X2.94/91 and X16.16/10 for open or short circuit. Check the circuit across A4.X2.94/69 and X16.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across K21 (Safety relay) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

677-4: The starter relay has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Monitoring continuously in ON and OFF state. • ECU not in after-run, Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
		[Fault Detection] • Hardware reports a Short Circuit to Ground error on HS power stage for the starter relay actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• Hardware does not report a Short Circuit to Ground error on HS power stage for the starter relay actuator.
System reaction		• Power stage shut off. • Further reactions according FID (see FID's)
		• 1) FId / Physical errors that could be detected when the Starter is in the Running state • 2) FId / Physical errors that could be detected when the Starter is in the Stopped state • 3) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Short circuit of wiring to ground or defective HS starter relay
Failure repair		• Check of wiring or replacement of HS starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K21 (Safety relay). Check the circuit across A4.X2.94/91 and K21.5/3 for open or short circuit. Check the circuit across A4.X2.94/69 and K21.5/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "K21 (Safety relay)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X16 (Intermediate connector). Check the circuit across A4.X2.94/91 and X16.16/10 for open or short circuit. Check the circuit across A4.X2.94/69 and X16.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across K21 (Safety relay) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

677-5: The starter relay has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Monitoring only when the power stage is inactive. • ECU not in after-run, Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
		[Fault Detection] • Hardware reports an open load (OL) error on power stage for the LS starter relay actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 90.00ms • Failure is detected if active for 25% of the time
Fault healing		• Hardware does not report an open load (OL) error on power stage for the LS starter relay actuator.
System reaction		• Power stage shut off. • Further reactions according FID (see FID's)
		• 1) FId / Physical errors that could be detected when the Starter is in the Stopped state • 2) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Broken or disconnected wiring or defective LS starter relay
Failure repair		• Check of wiring or replacement of LS starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K21 (Safety relay). Check the circuit across A4.X2.94/91 and K21.5/3 for open or short circuit. Check the circuit across A4.X2.94/69 and K21.5/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “K21 (Safety relay)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X16 (Intermediate connector). Check the circuit across A4.X2.94/91 and X16.16/10 for open or short circuit. Check the circuit across A4.X2.94/69 and X16.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across K21 (Safety relay) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

723-2: Defect Fault Check for Signal of camshaft.Data erratic, intermittent or incorrect

Generation condition		[Test Condition] • Diagnostics is active if engine is running and no error in the crankshaft speed sensor is present
		[Fault Detection] • If camshaft signal does not match pattern (edge distance, level) or not all expected camshaft edges detected during a engine revolution. Different monitoring strategies are active during synchronisation phase (engine start) and normal engine running.
		[Defect Debouncing] • Immediate
Fault healing		• If correct pattern is recognised.
System reaction		• If problem is detected at engine start, a redundant synchronisation of the angular system is performed using only the crankshaft increment signal and test injections to determine engine phase, if procedure fails the injection is aborted and the system waits for a restart. • See also FIDs list.
		• 1) FId / Camshaft position adaption (learning of real position to the theoretical one) inhibited • 2) FId / Camshaft offset diagnosis inhibited (due camshaft or crankshaft signal errors) • 3) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 4) FId / Offset test of Rail pressure sensor disabled • 5) FId / Offset test of Rail pressure sensor only released, if this failure path is tested • 6) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 7) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Cam Shaft speed signal not stable: • electrical intermittent open circuit • sensor not fixed correctly • electrical disturbances due to damaged isolation of wiring harness • electrical disturbances due to special electrical features
Failure repair		• Check wiring, sensor installation and proper functioning of camshaft phase sensor (evaluate raw signals) • Check if sensor fixed correctly (should not be moveable), check wiring harness and contacts, check if electrical lines with high electric performance are additionally installed (components not validated by the vehicle manufacturer).
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

723-9: Defect Fault Check for Signal of camshaft.No signal

Generation condition	[Test Condition] • Diagnostics is active if engine is running and no error in the crankshaft speed sensor is present
	[Fault Detection] • If crankshaft signal shows no errors and no camshaft edge is detected for at least 3.00- crankshaft gaps.
	[Defect Debouncing] • Immediate
Fault healing	• If at least one camshaft edge is detected since last crankshaft gap

https://truckmanualshub.com/

System reaction		• If problem is detected at engine start, a redundant synchronisation of the angular system is performed using only the crankshaft increment signal and test injections to determine engine phase, if procedure fails the injection is aborted and the system waits for a restart. • See also FIDs list.
		• 1) FId / Camshaft position adaption (learning of real position to the theoretical one) inhibited • 2) FId / Camshaft offset diagnosis inhibited (due camshaft or crankshaft signal errors) • 3) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 4) FId / Offset test of Rail pressure sensor disabled • 5) FId / Offset test of Rail pressure sensor only released, if this failure path is tested • 6) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 7) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Camshaft speed sensor defective • Wiring harness “open circuit” • Camshaft sensor not mounted
Failure repair		• Check if sensor mounted correctly • Check wiring harness • Check sensor functionality and replace it if necessary
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B35 (Position sensor Cylinder). Check the circuit across B35.3/3 and A4.X1.60/14 for open or short circuit. Check the circuit across B35.3/2 and A4.X1.60/53 for open or short circuit. Check the circuit across B35.3/1 and A4.X1.60/36 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B35 (Position sensor Cylinder)”. Reinstall all the removed connectors. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

723-31: Defect Fault Check for Signal of camshaft.Offset angle is exceeded.

Generation condition		[Test Condition] • Continuously when engine speed is detectable and no camshaft failures already detected
		[Fault Detection] • Offset between crankshaft signal and expected camshaft first edge <-10°C {14°F}rS OR > 10°C {50°F}rS for more than 4.00- consecutive cycles
		[Defect Debouncing] • Immediate
Fault healing		• Offset between crankshaft signal and expected camshaft first edge in range for at least 4.00- consecutive cycles.
System reaction		• If problem is detected at engine start, a redundant synchronisation of the angular system is performed using only the crankshaft increment signal and test injections to determine engine phase, if procedure fails the injection is aborted and the system waits for a restart. • See also FIDs list.
		• 1) FId / Status of function identifier FId_EngDemTrqLimErr1 • 2) FId / Torque limitation 3 activated for power reduction • 3) FId / Camshaft position adaption (learning of real position to the theoretical one) inhibited • 4) FId / Camshaft sensor diagnosis inhibited (due to sensor offset error) • 5) FId / Syncronisation between Cam and Crank shaft sensor not released and therefore fuel injection inhibited (--> no engine start) • 6) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 7) FId / Engine speed Limitation 3 for HIgh/Low engine speed (HLS) control active • 8) FId / Offset test of Rail pressure sensor disabled • 9) FId / Offset test of Rail pressure sensor only released, if this failure path is tested • 10) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 11) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Camshaft sensor position deviates form crankshaft position: • camshaft mal positioned (e.g. tooth belt: 1 tooth skipped) • camshaft position wheel mal positioned (if adjustable) • camshaft sensor position mal positioned (if adjustable) • crankshaft signal mal positioned (same as camshaft)
Failure repair		• Check correct positions of camshaft signal wheel and crankshaft signal wheel to piston position
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

917-9: CAN timeout fault

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Timeout of HRVD message
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the HRVD message is received correct after the debouncing time the DFC is healed.
System reaction	• The default value for Vehicle distance is used: • Dspl_IMlgHiRes = 0.00m;

https://truckmanualshub.com/

Failure cause		• Defective CAN controller of Body Computer, under voltage of BC missing BC, CAN cable connecting the Body Computer is disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the Body Computer to the network, Check correct functioning of the BC CAN controller and its voltage supply. Check wiring.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

931-3: Component 'Presupply pump' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only active pressure supply pump activated.
		[Fault Detection] • The power stage hardware reports a "short circuit to battery" (SCB) error.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 290.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1000.00ms 20.00- times in actual driving cycle. Failure healed, if the power stage does not report an SCB error. Else no healing possible at this driving cycle.
System reaction		• Power stage shut-off, i.e. the engine probably stalls or witches off due to too low fuel pressure. • Further reactions according FID (see FID)
		• 1) FId / Status of function identifier FId_EngDemTrqLimErr1 • 2) FId / Torque limitation 2 activated for power reduction • 3) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 4) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Short circuit of wiring to external source or inside presupply pump
Failure repair		• Check of wiring or replace pre supply pump
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Remove the connector of A41 (Electric fuel pump). Remove the connector of Ground. Check the circuit across A4.X2.94/27 and A20.X10.14/3 for open or short circuit. Check the circuit across A41.4/4 and A20.X10.14/13 for open or short circuit. Check the circuit across A41.4/3 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "A41 (Electric fuel pump)". Reinstall all the removed connectors. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Remove the connector of X45 (Intermediate connector). Remove the connector of Ground. Check the circuit across A4.X2.94/27 and A20.X10.14/3 for open or short circuit. Check the circuit across X45.12/3 and Ground for open or short circuit. Check the circuit across X45.12/4 and A20.X10.14/13 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Repair or replace the harness across A41 (Electric fuel pump) and X45 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X45 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

https://truckmanualshub.com/

931-4: Component 'Presupply pump' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only active pressure supply pump NOT activated, i.e. 30.00s after Key 15 "on" at engine stand still or after engine speed < 50.00rpm (i.e. after Key 15 off or engine stall)
		[Fault Detection] • The power stage hardware reports a "short circuit to ground" (SCG) error.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 270.00ms • Failure is detected if active for 25% of the time
Fault healing		• The power stage does not report an "short to ground" (SCG) error.
System reaction		• Power stage shut-off, i.e. the engine probably stalls or witches off due to too low fuel pressure. • Further reactions according FID (see FID)
		• 1) FId / Status of function identifier FId_EngDemTrqLimErr1 • 2) FId / Torque limitation 2 activated for power reduction • 3) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 4) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Short circuit of wiring to ground or inside presupply pump
Failure repair		• Check of wiring or replace pre supply pump
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Remove the connector of A41 (Electric fuel pump). Remove the connector of Ground. Check the circuit across A4.X2.94/27 and A20.X10.14/3 for open or short circuit. Check the circuit across A41.4/4 and A20.X10.14/13 for open or short circuit. Check the circuit across A41.4/3 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "A41 (Electric fuel pump)". Reinstall all the removed connectors. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Remove the connector of X45 (Intermediate connector). Remove the connector of Ground. Check the circuit across A4.X2.94/27 and A20.X10.14/3 for open or short circuit. Check the circuit across X45.12/3 and Ground for open or short circuit. Check the circuit across X45.12/4 and A20.X10.14/13 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Repair or replace the harness across A41 (Electric fuel pump) and X45 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X45 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

931-5: Presupply pumpCurrent below normal or Open circuit

Generation condition	[Test Condition] • Monitoring only active pressure supply pump NOT activated, i.e. 30.00s after Key 15 “on” at engine stand still or after engine speed < 50.00rpm (i.e. after Key 15 off or engine stall)
	[Fault Detection] • The power stage hardware reports a “open load” (OL) error.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 290.00ms • Failure is detected if active for 25% of the time
Fault healing	• The power stage does not report an “open load” (OL) error.
System reaction	• Power stage shut-off, i.e. the engine probably stalls or witches off due to too low fuel pressure. • Further reactions according FID (see FID)
	• 1) FId / Status of function identifier FId_EngDemTrqLimErr1 • 2) FId / Torque limitation 2 activated for power reduction • 3) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 4) FId / Inhibit ISS, max number of engine starts exceeded

https://truckmanualshub.com/

Failure cause		• Broken or disconnected wiring or defective presupply pump
Failure repair		• Check of wiring or replace pre supply pump
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Remove the connector of A41 (Electric fuel pump). Remove the connector of Ground. Check the circuit across A4.X2.94/27 and A20.X10.14/3 for open or short circuit. Check the circuit across A41.4/4 and A20.X10.14/13 for open or short circuit. Check the circuit across A41.4/3 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “A41 (Electric fuel pump)”. Reinstall all the removed connectors. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Remove the connector of X45 (Intermediate connector). Remove the connector of Ground. Check the circuit across A4.X2.94/27 and A20.X10.14/3 for open or short circuit. Check the circuit across X45.12/3 and Ground for open or short circuit. Check the circuit across X45.12/4 and A20.X10.14/13 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Repair or replace the harness across A41 (Electric fuel pump) and X45 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X45 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

931-12: Component ‘Presupply pump’ signals overtemperature.

Generation condition		[Test Condition] • Monitoring only active pressure supply pump activated.
		[Fault Detection] • The power stage detects an over temperature (OT) error.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 270.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1.00s 20.00- times in actual driving cycle. Failure healed, if the power stage does not report an OT error. Else no healing possible at this driving cycle.
System reaction		• Power stage shut-off, i.e. the engine probably stalls or witches off due to too low fuel pressure. • Further reactions according FID (see FID)
		• 1) FId / Status of function identifier FId_EngDemTrqLimErr1 • 2) FId / Torque limitation 2 activated for power reduction • 3) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 4) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• No reaction needed if failure isn’t present after short time, check load and output, check wiring, replace ECU
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Remove the connector of A41 (Electric fuel pump). Remove the connector of Ground. Check the circuit across A4.X2.94/27 and A20.X10.14/3 for open or short circuit. Check the circuit across A41.4/4 and A20.X10.14/13 for open or short circuit. Check the circuit across A41.4/3 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “A41 (Electric fuel pump)”. Reinstall all the removed connectors. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Remove the connector of X45 (Intermediate connector). Remove the connector of Ground. Check the circuit across A4.X2.94/27 and A20.X10.14/3 for open or short circuit. Check the circuit across X45.12/3 and Ground for open or short circuit. Check the circuit across X45.12/4 and A20.X10.14/13 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Repair or replace the harness across A41 (Electric fuel pump) and X45 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X45 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

959-9: CAN Timeout Error during CAN-receive-frame Time Date.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuous
	[Fault Detection] • TimeDate message timeout detected
	[Defect Debouncing] • Defect condition fulfilled continuously >1000.0 ms
Fault healing	• TimeDate message received
System reaction	• Time/Date set to fix replacement value: • Year = 2240.00y • Month = 1.00mon • Day = 1.00d • Hour = 0.00h • Minutes = 0.00min • Seconds = 0.00s
	• 1) FId / Plausibilty check of temperature sensors at cold start not allowed • 2) FId / Inhibit temperature sampling • 3) FId / Inhibit plaus.check engine coolant temperature at cold start • 4) FId / Fuel temperature plausibility error detected • 5) FId / Inhibit plausibility check of EGR Cooler Temperature Downstream • 6) FId / Status of function identifier FID_UHCWrmStrtChk; Status des Functions Identifiers FID_UHCWrmStrtChk • 7) Fid / Substitute function for Time date receive frame
Failure cause	• Defective CAN controller of Tachograph or Instrument Cluster, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the Tachograph or of the Instrument Cluster to the network, Check correct functioning of the CAN controller. Check wiring.

https://truckmanualshub.com/

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with A11 (Meter cluster) is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of A11 (Meter cluster). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A11 (Meter cluster). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

980-9: CAN Timeout Error during CAN-receive-frame PTO.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Timeout of RxPTO message is detected
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the RxPTO message is received correct, after the debouncing time the DFC is healed
System reaction	• Power takeoff switch status is set to default value 0.00-
Failure cause	• Defective CAN controller of SAM Interface or PTO, CAN cable connecting the interface is disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the SAM and PTO Interface to the network. Check wiring.

1074-3: The output for actuation of component 'Exhaust Flap' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is active.
		[Fault Detection] • Hardware reports a short circuit to battery (SCB) error on the power stage for the Exhaust Flap actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 150.00ms. Failure healed, if the power stage does not report an SCB error.
System reaction		• Power stage is shut-off (Exhaust Flap in open position). • Further reactions according FID (see FID's)
		• 1) FId / Engine brake at fix position (EngBrk_rBrkDfl_C) • 2) FId / Particulate filter ((DPF) Regeneration inhibited • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / Inhibit Charged Air Cooler monitoring
Failure cause		• Short circuit of wiring to external source or defective exhaust flap actuator
Failure repair		• Check of wiring or replace exhaust flap actuator
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y9 (Engine brake Solenoid valve). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X1.60/34 and Y9.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and Y9.3/3 for open or short circuit. Check the circuit across Ground and Y9.3/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "Y9 (Engine brake Solenoid valve)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across Ground and X39.12/8 for open or short circuit. Check the circuit across A20.X10.14/2 and X39.12/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across Y9 (Engine brake Solenoid valve) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A20 (SAM) and X39. Repair or replace the harness across Ground and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1074-4: The exhaust flap has a short circuit to ground. / Component '10271-491' has a mechanical defect.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
		[Fault Detection] • Hardware reports a short circuit to ground (SCG) error on the power stage for the Exhaust Flap Actuator.
		[Defect Debouncing] • Defect condition fulfilled continuously >40000.0 ms
Fault healing		• Hardware does not report a short circuit to ground (SCG) error on the power stage for the Exhaust Flap Actuator.
System reaction		• Power stage is shut-off Exhaust Flap Actuator in open position). • Further reactions according FID (see FID's)
		• 1) FId / Engine brake at fix position (EngBrk_rBrkDfl_C) • 2) FId / Particulate filter ((DPF) Regeneration inhibited • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / Inhibit Charged Air Cooler monitoring
Failure cause		• Short circuit of wiring to ground or defective Exhaust Flap Actuator
Failure repair		• First Check wiring, if no short circuit found replace Exhaust Flap Actuator
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y9 (Engine brake Solenoid valve). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X1.60/34 and Y9.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and Y9.3/3 for open or short circuit. Check the circuit across Ground and Y9.3/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y9 (Engine brake Solenoid valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across Ground and X39.12/8 for open or short circuit. Check the circuit across A20.X10.14/2 and X39.12/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across Y9 (Engine brake Solenoid valve) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A20 (SAM) and X39. Repair or replace the harness across Ground and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

https://truckmanualshub.com/

1074-5: The output for actuation of component 'Exhaust Flap' has an electrical fault or open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
		[Fault Detection] • Hardware reports an open load (OL) error on power stage for the Exhaust Flap Actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Hardware does not report an open load (OL) error on power stage for the Exhaust Flap Actuator.
System reaction		• Power stage shut off (Throttle Valve Actuator in open position). • Further reactions according FID (see FID's)
		• 1) FId / Engine brake at fix position (EngBrk_rBrkDfl_C) • 2) FId / Particulate filter ((DPF) Regeneration inhibited • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / Inhibit Charged Air Cooler monitoring
Failure cause		• Broken or disconnected wiring or defective Exhaust Flap Actuator
Failure repair		• Check of wiring, replace Exhaust Flap Actuator
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y9 (Engine brake Solenoid valve). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X1.60/34 and Y9.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and Y9.3/3 for open or short circuit. Check the circuit across Ground and Y9.3/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "Y9 (Engine brake Solenoid valve)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across Ground and X39.12/8 for open or short circuit. Check the circuit across A20.X10.14/2 and X39.12/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across Y9 (Engine brake Solenoid valve) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A20 (SAM) and X39. Repair or replace the harness across Ground and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1074-12: Over temperature error on power stage for Exhaust Flap Actuator.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is active.
		[Fault Detection] • Hardware reports an over temperature error (OT) on the power stage for the Exhaust Flap actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1.00s. Failure healed, if the power stage does not report an Over temperature error.
System reaction		• Power stage is shut-off (Exhaust Flap in open position). • Further reactions according FID (see FID's)
		• 1) FId / Inhibit Charged Air Cooler monitoring
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• Check load and output, check wiring, replace ECU
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y9 (Engine brake Solenoid valve). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X1.60/34 and Y9.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and Y9.3/3 for open or short circuit. Check the circuit across Ground and Y9.3/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y9 (Engine brake Solenoid valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across Ground and X39.12/8 for open or short circuit. Check the circuit across A20.X10.14/2 and X39.12/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across Y9 (Engine brake Solenoid valve) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A20 (SAM) and X39. Repair or replace the harness across Ground and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

1076-3: Pressure control valve: Voltage above normal or shorted to high source

Generation condition		[Test Condition] • Monitoring only when the power stage is active • Battery voltage > 9.50V (switch off < 9.00V)
		[Fault Detection] • Hardware reports a Short Circuit to Battery error on power stage for Pressure Control Valve Low Side
		[Defect Debouncing] • Defect condition exceeded cumulatively > 280.00ms • Failure is detected if active for 25% of the time
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• Power stage shut off. • Further reactions according FID (see FID's)
		• 1) FId / Status of function identifier FId_EngDemTrqLimErr1 • 2) FId / Torque limitation 2 activated for power reduction • 3) FId / Reset Metering Unit adaption value • 4) FId / AD Channel of Fuel rail pressure defect / Open loop control of fuel pressure control valve • 5) FId / Substitute reaction: In the event of an error, a regeneration is prevented or a currently-running regeneration is interrupted. • 6) FId / Fuel pressure control exclusively made by pressure control valve (PCV) in current driving cycle • 7) FId / Monitoring of positive governor deviation of fuel rail pressure with Control by Metering Unit disabled • 8) FId / Monitoring of positive governor deviation of fuel rail pressure and Fuel delivery Set point with Control by Metering Unit released • 9) FId / Monitoring of negative governor deviation of fuel rail pressure at fuel delivery with Control by Metering Unit disabled • 10) FId / Monitoring of maximum rail pressure with Control by Metering Unit disabled • 11) FId / Closed loop control of fuel rail pressure by pressure control valve PCV disabled (control exclusively with metering unit MeUn) • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) FId / Status of function identifier FId_PFltLmp • 15) FId / Inhibit monitor for DPF frequent regeneration • 16) FId / Inhibit monitor for incomplete regeneration of the DPF • 17) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Short circuit of wiring to battery or inside Pressure Control Valve at Low Side
Failure repair		• Check of wiring, replace Pressure Control Valve
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y29 (Pressure limiting valve in rail). Check the circuit across Y29.2/1 and A4.X1.60/45 for open or short circuit. Check the circuit across Y29.2/2 and A4.X1.60/15 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "Y29 (Pressure limiting valve in rail)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y29 (Pressure limiting valve in rail) which A4 (Combustion engine Control unit) learns. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1076-4: Pressure control valve: Voltage below normal or shorted to low source

Generation condition	[Test Condition] • Battery voltage > 9.50V (switch off < 9.00V)
	[Fault Detection] • Hardware reports a Short Circuit to Ground error on power stage for Pressure Control Valve Low Side
	[Defect Debouncing] • Defect condition exceeded cumulatively > 220.00ms • Failure is detected if active for 25% of the time
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• Power stage shut off. • Further reactions according FID (see FID's)
	• 1) FId / Energizing time for injectors forced to minimum (= no fuel injection = engine stop) • 2) FId / PreSupply Pump switched off • 3) FId / PreSupply Pump switched off • 4) FId / Fuel pressure set to minimum (= engine stop) • 5) FId / Inhibit ISS, max number of engine starts exceeded • 6) FId / Single Injector shut off test inhibited • 7) FId / AD Channel of Fuel rail pressure defect / Open loop control of fuel pressure control valve • 8) FId / Closing of metering unit forced (full fuel feeding) • 9) FId / Inhibit monitor for DPF frequent regeneration • 10) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause	• Short circuit of wiring to ground or inside Pressure Control Valve at Low Side
Failure repair	• Check of wiring, replace Pressure Control Valve

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y29 (Pressure limiting valve in rail). Check the circuit across Y29.2/1 and A4.X1.60/45 for open or short circuit. Check the circuit across Y29.2/2 and A4.X1.60/15 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y29 (Pressure limiting valve in rail)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y29 (Pressure limiting valve in rail) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1076-5: Pressure control valve: Current below normal or Open circuit

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Monitoring only when the power stage is NOT active. • Battery voltage > 9.50V (switch off < 9.00V)
	[Fault Detection] • Hardware reports “open load” (OL) error
	[Defect Debouncing] • Defect condition exceeded cumulatively > 280.00ms • Failure is detected if active for 50% of the time
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

		• Power stage switched off, i.e. engine probably stops as no fuel pressure in rail is possible (valve in opened position without current) • Further reactions according FID (see FID's)
System reaction		• 1) FId / Energizing time for injectors forced to minimum (= no fuel injection = engine stop) • 2) FId / Fuel quantity set to (= engine stop) • 3) FId / PreSupply Pump switched off • 4) FId / Fuel pressure set to minimum (= engine stop) • 5) FId / Engine torque forced to (=engine stop) • 6) FId / AD Channel of Fuel rail pressure defect / Open loop control of fuel pressure control valve • 7) FId / Inhibit DPF efficiency monitor • 8) FId / Interrupt DPF efficiency monitor • 9) FId / Inhibit monitor for DPF frequent regeneration • 10) FId / Inhibit monitor for incomplete regeneration of the DPF • 11) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Broken or disconnected wiring or defective pressure control valve
Failure repair		• Check of wiring or replace relay or pressure control valve
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y29 (Pressure limiting valve in rail). Check the circuit across Y29.2/1 and A4.X1.60/45 for open or short circuit. Check the circuit across Y29.2/2 and A4.X1.60/15 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "Y29 (Pressure limiting valve in rail)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y29 (Pressure limiting valve in rail) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

https://truckmanualshub.com/

1076-12: Pressure control valve: Overtemperature

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Monitoring only when the power stage is active. • Battery voltage > 9.50V (switch off < 9.00V)
		[Fault Detection] • Hardware reports “over temperature” (OT) error
		[Defect Debouncing] • Defect condition exceeded cumulatively > 280.00ms • Failure is detected if active for 50% of the time
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• Power stage switched off, i.e. engine probably stops as no fuel pressure in rail is possible (valve in opened position without current) • Further reactions according FID (see FID’s)
		• 1) FId / Energizing time for injectors forced to minimum (= no fuel injection = engine stop) • 2) FId / Fuel quantity set to (= engine stop) • 3) FId / PreSupply Pump switched off • 4) FId / Fuel pressure set to minimum (= engine stop) • 5) FId / Engine torque forced to (=engine stop) • 6) FId / AD Channel of Fuel rail pressure defect / Open loop control of fuel pressure control valve • 7) FId / Inhibit DPF efficiency monitor • 8) FId / Interrupt DPF efficiency monitor • 9) FId / Inhibit monitor for DPF frequent regeneration • 10) FId / Inhibit monitor for incomplete regeneration of the DPF • 11) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Short circuit of wiring or internal failure of pressure control valve
Failure repair		• Check of wiring and pressure control valve.
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y29 (Pressure limiting valve in rail). Check the circuit across Y29.2/1 and A4.X1.60/45 for open or short circuit. Check the circuit across Y29.2/2 and A4.X1.60/15 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y29 (Pressure limiting valve in rail)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y29 (Pressure limiting valve in rail) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

https://truckmanualshub.com/

	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1076-16: Pressure control valve: Learning factorHIGH

Generation condition		[Test Condition] • Adaptation was active, i.e.: • engine running • Fuel temperature between 4.96°C {40.93°F} and 69.96°C. • Fuel pressure between 50MPa {7250psi, 510kgf/cm^2} and 150MPa {21750psi, 1530kgf/cm^2} • The ratio desired / measured fuel pressure < 0.02- • The ratio desired / measured current to pressure control valve < 0.02- • all the above conditions must be fulfilled for 5.00- “tasks” to guarantee stable situation. • if all conditions fulfilled the desired and measured fuel pressures are averaged over 5.00- “tasks” • the adaptation factor is calculated comparing the averaged desired and measured pressure, which is stored in the EEPROM and used for the current calculation for pressure control valve.
		[Fault Detection] • The calculated adaptation factor > 1.30-
		[Defect Debouncing] • Immediate
Fault healing		• The calculated adaptation factor < 1.30-
System reaction		• Only according FID (see FID’s)
		• 1) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• The actual pressure is higher for a certain current than according specification. This can be caused by an additional current through the pressure control valve (partial short circuit in wiring) which is not measured in ECU. • Fuel pressure control valve not OK.
Failure repair		• Check wiring and pressure control valve. • Replace pressure control valve and reset EEPROM learning datas resp. execute first learning with tester.
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y29 (Pressure limiting valve in rail). Check the circuit across Y29.2/1 and A4.X1.60/45 for open or short circuit. Check the circuit across Y29.2/2 and A4.X1.60/15 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y29 (Pressure limiting valve in rail)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y29 (Pressure limiting valve in rail) which A4 (Combustion engine Control unit) learns. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1076-18: Pressure control valve: Learning factorLOW

Generation condition	[Test Condition] • Adaptation was active, i.e.: • engine running • Fuel temperature between 4.96°C {40.93°F} and 69.96°C. • Fuel pressure between 50MPa {7250psi, 510kgf/cm^2} and 150MPa {21750psi, 1530kgf/cm^2} • The ratio desired / measured fuel pressure < 0.02- • The ratio desired / measured current to pressure control valve < 0.02- • all the above conditions must be fulfilled for 5.00- “tasks” to guarantee stable situation. • if all conditions fulfilled the desired and measured fuel pressures are averaged over 5.00- “tasks” • the adaptation factor is calculated comparing the averaged desired and measured pressure, which is stored in the EEPROM and used for the current calculation for pressure control valve.
	[Fault Detection] • The calculated adaptation < 0.70-
	[Defect Debouncing] • Immediate
Fault healing	• The calculated adaptation factor >0.70-
System reaction	• Only according FID (see FID’s)
	• 1) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause	• The actual pressure is lower for a certain current than according specification. This can be caused by a “current loss” by the wiring (partial short circuit in wiring) which does not go through the pressure control valve. • Fuel pressure control valve not OK.
Failure repair	• Check wiring and pressure control valve. • Replace pressure control valve and reset EEPROM learning datas resp. execute first learning with tester.

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y29 (Pressure limiting valve in rail). Check the circuit across Y29.2/1 and A4.X1.60/45 for open or short circuit. Check the circuit across Y29.2/2 and A4.X1.60/15 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y29 (Pressure limiting valve in rail)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y29 (Pressure limiting valve in rail) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

1127-15: Boost pressure control: Too Low Boost pressure in closed loop control - Data Valid But Above Normal Operating Range - Least Severe Level

Generation condition	[Test Condition] • Continuous monitoring if each of following conditions are fulfilled: • The engine is in the working range 3 or 4 of the closed-loop boost-pressure control, i.e. engine speed > 1250.00rpm and engine load > 26.00mg/hub • The system is not in cold start condition, i.e. the engine is running longer than starting temperature dependant time if engine speed is between 0.00rpm and 800.00rpm (no cold start condition recognised at engine speed > 800.00rpm) • The Clutch is not activated longer than 3.00s at engine load > 6.00mg/hub • The engine brake is not activated • The closed loop control is not switched off due to detected permanent control deviation, limited VGT actuator functionality (FID_PCRCmpActv or FID_PCR)) or turbocharger hysteresis • The closed loop control is not switched of by FID (FID_PCR_GovDev) due to another failure
	[Fault Detection] • The actually measured boost pressure is lower than the desired pressure an the difference is higher than an engine speed and load dependant max allowed value.
	[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• No direct reaction at engine speed < 2750.00rpm OR engine load < 33.00mg/hub • At engine speed > 2750.00rpm and engine load > 33.00mg/hub the system switches to “open loop control” • Generally reduced power possible due to too low Boost pressure (smoke limitation active) or by FID (see FID’s)
	• 1) FId / Air mass flow calculated by gas equation (boost pressure, boost temperature, engine speed) instead of measuring by air flow meter (HFM/AFS) • 2) FId / EGR switched off • 3) FId / Deactivates NOx monitoring • 4) FId / Reciprocal lambda signal replaced by substitute value for modelling • 5) FId / Status of function identifier FId_EngDemTrqLimErr1 • 6) FId / Torque limitation 2 activated for power reduction • 7) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 8) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 9) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 10) FId / The Adaptation of lambda Sensor disabled • 11) FId / The Difference Check between several Lambda Sensors is disabled • 12) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 13) FId / Electrical Open Load Check of Lambda Sensor disabled • 14) FId / O2 Signal of Lambda Sensor not valid • 15) FId / Monitoring of Boost pressure deviation disabled • 16) FId / Inhibit DPF monitor • 17) FId / Particulate filter ((DPF) Regeneration inhibited • 18) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 19) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 20) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 21) FId / Inhibit Charged Air Cooler monitoring • 22) FId / Inhibit EGR cooler efficiency monitoring • 23) FId / Calculation of Turbocharger Compressor Temperature inhibited • 24) FId / Inhibit monitor for DPF frequent regeneration • 25) FId / Inhibit monitor for incomplete regeneration of the DPF • 26) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled

https://truckmanualshub.com/

Failure cause		• Mechanically blocked boost pressure actuator • Electrical defect in actuator • In case of VTG control by pressure or vacuum: No sub pressure at VTG actuator • Foreign matter in the intake duct (deposits etc.). • Leakage in air system (e.g. tube compressor - Intercooler or intercooler - manifold) • Boost pressure sensor measures wrong values • EGR tube or EGR cooler clogged partially (reason: exhaust flap closes to reach desired air flow) • EGR valve does not open fully (reason: exhaust flap closes to reach desired air flow)
Failure repair		• Check mechanical and electrical functionality of the actuator for VTG • If present: Check system of sub pressure • Ensure that the EGR actuators are functioning correctly • Check intake duct to deposits and/or leakages • Check Boost pressure sensor • Check EGR system (tube clogged, correct EGr valve function)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘Y21 (Actuator in turbocharger)’ is faulty. Component ‘Y21 (Actuator in turbocharger)’ is stuck. Plugged Piping for Y21 (Actuator in turbocharger) Negative pressure of Y21 (Actuator in turbocharger) Damage of Intake system Plugged Intake system Plugged Piping for EGR Plugged EGR cooler Component ‘A14 (EGR valve)’ is stuck. Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary. For procedures, refer to the Shop Manual Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B19 (Pressure and temperature sensor Turbocharger). Check the circuit across B19.4/3 and A4.X1.60/25 for open or short circuit. Check the circuit across B19.4/2 and A4.X1.60/12 for open or short circuit. Check the circuit across B19.4/4 and A4.X1.60/13 for open or short circuit. Check the circuit across B19.4/1 and A4.X1.60/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step9
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B19 (Pressure and temperature sensor Turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Perform learning of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5

1127-17: Too High Boost pressure in closed loop control.Data Valid But Above Normal Operational Range.

Generation condition	[Test Condition] • Continuous monitoring if each of following conditions are fulfilled: • The engine is in the working range 3 or 4 of the closed-loop boost-pressure control, i.e. engine speed > 1250.00rpm and engine load > 26.00mg/hub • The system is not in cold start condition, i.e. the engine is running longer than starting temperature dependant time if engine speed is between 0.00rpm and 800.00rpm (no cold start condition recognised at engine speed > 800.00rpm) • The Clutch is not activated longer than 3.00s at engine load > 6.00mg/hub • The engine brake is not activated • The closed loop control is not switched off due to detected permanent control deviation, limited VGT actuator functionality (FID_PCRCmpActv or FID_PCR)) or turbocharger hysteresis • The closed loop control is not switched of by FID (FID_PCR_GovDev) due to another failure
	[Fault Detection] • The actually measured boost pressure is higher than the desired pressure an the difference is higher than an engine speed and load dependant max allowed value.
	[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

System reaction		• No direct reaction at engine speed < 2750.00rpm OR engine load < 33.00mg/hub • At engine speed > 2750.00rpm and engine load > 33.00mg/hub the system switches to “open loop control” • Probably power reduction to protect VGT against overspeed (see FID)
		• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) FId / Status of function identifier FId_EngDemTrqLimErr1 • 4) FId / Torque limitation 2 activated for power reduction • 5) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 6) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 7) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 8) FId / The Adaptation of lambda Sensor disabled • 9) FId / The Difference Check between several Lambda Sensors is disabled • 10) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 11) FId / Electrical Open Load Check of Lambda Sensor disabled • 12) FId / O2 Signal of Lambda Sensor not valid • 13) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 14) FId / Monitoring of Boost pressure deviation disabled • 15) FId / Inhibit DPF monitor • 16) FId / Particulate filter ((DPF) Regeneration inhibited • 17) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 18) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 19) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 20) FId / Inhibit Charged Air Cooler monitoring • 21) FId / Inhibit EGR cooler efficiency monitoring • 22) FId / Calculation of Turbocharger Compressor Temperature inhibited • 23) FId / Inhibit monitor for DPF frequent regeneration • 24) FId / Inhibit monitor for incomplete regeneration of the DPF • 25) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled
Failure cause		• Mechanically blocked boost pressure actuator • Electrical defect in actuator • Boost pressure sensor measures too high values
Failure repair		• Check mechanical and electrical functionality of the actuator • If there is not failure detected in VGT, check Boost pressure sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘Y21 (Actuator in turbocharger)’ is faulty. Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B19 (Pressure and temperature sensor Turbocharger). Check the circuit across B19.4/3 and A4.X1.60/25 for open or short circuit. Check the circuit across B19.4/2 and A4.X1.60/12 for open or short circuit. Check the circuit across B19.4/4 and A4.X1.60/13 for open or short circuit. Check the circuit across B19.4/1 and A4.X1.60/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step9
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B19 (Pressure and temperature sensor Turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Perform learning of B19 (Pressure and temperature sensor Turbocharger) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5

1136-2: SPI Error ECU temperature sensor (LM71).Data erratic, intermittent or incorrect

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • When error message sent from sensor is detected (TECU_numSPI, bit 0 or 1 NOT set).
	[Defect Debouncing] • Defect condition exceeded cumulatively > 50.00 events • Failure is detected if active for 50% of events
Fault healing	• When correct message sent from sensor is detected (TECU_numSPI, bit 0 AND bit 1 set).

https://truckmanualshub.com/

System reaction		• Temperature is frozen at last valid value during failure debouncing and ramps to 40.96°C {105.73°F} if failure is validated using slope 3.00K/s (downwards) or 3.00K/s (upwards) • Further reactions according FID (see FID's)
		• 1) Fid / Classification and duration of intake air temperature for Trip recorder inhibited • 2) FId / The ECU temperature is set to and thermal management of ECU disabled • 3) FId / Freeze ECU temperature value if preliminary failure is detected • 4) FId / Replace ECU temperature with default value if failure is validated
Failure cause		• Temperature sensor defective (inside ECM)
Failure repair		• Replace ECM
Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

1136-16: Physical Signal ECU temperature is above maximum limit.Data Valid But Above Normal Operational Range.

Generation condition		[Test Condition] • Range check is not inhibited by another failure (FId_TECUPhysRng is not set)
		[Fault Detection] • The sensed sensor signal TECU_tSens is above 129.96°C {265.93°F}
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing		• The sensed sensor signal TECU_tSens is below 129.96°C {265.93°F}
System reaction		• Temperature is frozen at last valid value on preliminary failure and ramps to fixed replacement value 40.96°C {105.73°F} if failure is validated using slope 3.00K/s or 3.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) FId / The ECU temperature is set to and thermal management of ECU disabled
Failure cause		• Inaccurate or defective temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the temperature sensor and replace it if necessary
Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

1136-18: Physical Signal ECU temperature is below minimum limit.Data valid but below normal operational range

Generation condition		[Test Condition] • Range check is not inhibited by another failure (FId_TECUPhysRng is not set)
		[Fault Detection] • The sensed sensor signal TECU_tSens is below -40.04°C {-40.07°F}
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing		• The sensed sensor signal TECU_tSens is above -40.04°C {-40.07°F}

https://truckmanualshub.com/

System reaction		• Temperature is frozen at last valid value on preliminary failure and ramps to fixed replacement value 40.96°C {105.73°F} if failure is validated using slope 3.00K/s or 3.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) FId / The ECU temperature is set to and thermal management of ECU disabled
Failure cause		• Inaccurate or defective temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the temperature sensor and replace it if necessary
Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

1172-2: Component 'Intake air temperature sensor 1' has a plausibility error.

Generation condition		[Test Condition] • Once in a driving cycle at ECM start if an engine cold start has been detected: • monitoring not inhibited by another failure (FId_AirTMonPlausCSOk not set) • engine speed = 0 • Engine OFF time > 5.00h
		[Fault Detection] • The value of temperature sensor at ECM start configured here is compared with to all other temperature values used for the plausibility check using a map with limit differences depending on engine Off time (Air_tDiffPlausMax_MAP). • If it is identified as deviating from normal value the fault is set.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Temperature value measured for the considered sensor is plausible. Healing possible only at next plausible check (after ECM restart)
System reaction		• None except FIDs
		• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) FId / Inhibit Charged Air Cooler monitoring • 3) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• The temperature sensor is drifted
Failure repair		• Check temperature sensor
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

1173-2: Component 'Intake air temperature sensor 2' has a plausibility error.

Generation condition		[Test Condition] • Once in a driving cycle at ECM start if an engine cold start has been detected: • monitoring not inhibited by another failure (FId_AirTMonPlausCSOk not set) • engine speed = 0 • Engine OFF time > 5.00h
		[Fault Detection] • The value of temperature sensor at ECM start configured here is compared with to all other temperature values used for the plausibility check using a map with limit differences depending on engine Off time (Air_tDiffPlausMax_MAP). • If it is identified as deviating from normal value the fault is set.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time

https://truckmanualshub.com/

Fault healing		• Temperature value measured for the considered sensor is plausible. Healing possible only at next plausible check (after ECM restart)
System reaction		• None except FIDs
		• 1) FId / Inhibit Charged Air Cooler monitoring • 2) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• The temperature sensor is drifted
Failure repair		• Check temperature sensor
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

1174-2: Component 'Intake air temperature sensor 3' has a plausibility error.

Generation condition		[Test Condition] • Once in a driving cycle at ECM start if an engine cold start has been detected: • monitoring not inhibited by another failure (FId_AirTMonPlausCSOk not set) • engine speed = 0 • Engine OFF time > 5.00h
		[Fault Detection] • The value of temperature sensor at ECM start configured here is compared with to all other temperature values used for the plausibility check using a map with limit differences depending on engine Off time (Air_tDiffPlausMax_MAP). • If it is identified as deviating from normal value the fault is set.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Temperature value measured for the considered sensor is plausible. Healing possible only at next plausible check (after ECM restart)
System reaction		• None except FIDs
		• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) FId / Inhibit Charged Air Cooler monitoring • 3) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• The temperature sensor is drifted
Failure repair		• Check temperature sensor
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

1175-2: Signal Range Check (SRC) for 'Charge air temperature downstream of charge air cooler' reports Implausible data.

Generation condition		[Test Condition] • Once in a driving cycle at ECM start if an engine cold start has been detected: • monitoring not inhibited by another failure (FId_AirTMonPlausCSOk not set) • engine speed = 0 • Engine OFF time > 5.00h
		[Fault Detection] • The value of temperature sensor at ECM start configured here is compared with to all other temperature values used for the plausibility check using a map with limit differences depending on engine Off time (Air_tDiffPlausMax_MAP). • If it is identified as deviating from normal value the fault is set.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Temperature value measured for the considered sensor is plausible. Healing possible only at next plausible check (after ECM restart)
System reaction		• None except FIDs
		• 1) FId / Inhibit plausibility check of EGR Cooler Temperature Downstream • 2) FId / Inhibit plausibility check of EGR Cooler Temperature Downstream • 3) FId / Inhibit Charged Air Cooler monitoring • 4) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• The temperature sensor is drifted
Failure repair		• Check temperature sensor
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

1213-2: Information from Instrument Cluster reports MIL internal circuit failure.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • If the MIL lamp is switched on due to internal circuit failure in the instrument panel which is sent via CAN from the instrument cluster ECU (Com_stSPNDM1IC_mp = 1)
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• MIL lamp intact (Com_stSPNDM1IC_mp = 0)
System reaction	• Com_stICMILReq is set to applicable replacement value • 0.00-
Failure cause	• Defective Instrument Cluster
Failure repair	• Check Instrument Cluster

https://truckmanualshub.com/

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with A11 (Meter cluster) is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of A11 (Meter cluster). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A11 (Meter cluster). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

1254-31: Information: Torque limitation by too high NOx emissions.

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun • Continuous monitoring
		[Fault Detection] • The OBD performance limitation is activated, if there is a failure active, which causes high NOx emissions for a certain time (24855.13d, 0.00s, 0.00s or 24855.13d depending on the failure). The performance limiter is activated immediately within 5.00min or 5.00min (depending on limitation).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the failure which caused the high NOx disappears, the performance limiter is released within 5.00s or 5.00s (depending on limitation) immediately.
System reaction		• Reduced power due OBD performance limiter 1 or 2 active
Failure cause		• Active power reduction due to the OBD performance limiter because of too high NOx emissions
Failure repair		• Check which failure activated the performance limitation (FID_CoVehPrfmLim%%OBD with %%=11,12,21 or 22) and perform troubleshooting on the basis of this defect. • Note: The OBD performance limiter can be disabled with service tester at maximum 3.00- times for 60.00min each time, to give the possibility to drive also a fully loaded vehicle to the next repair station.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

1321-3: The starter relay has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Monitoring only when the power stage is active. • ECU not in after-run, Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
		[Fault Detection] • Hardware reports a Short Circuit to Battery error on LS power stage for the starter relay actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1000.00ms 5.00- times in actual driving cycle. Failure healed, if the power stage does not report a Short Circuit to Battery error. Else no healing possible at this driving cycle.
System reaction		• Power stage shut off. • Further reactions according FID (see FID's)
		• 1) FId / Physical errors that could be detected when the Starter is in the Running state • 2) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Short circuit of wiring to external source or defective LS starter relay
Failure repair		• Check of wiring or replacement of LS starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K21 (Safety relay). Check the circuit across A4.X2.94/91 and K21.5/3 for open or short circuit. Check the circuit across A4.X2.94/69 and K21.5/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "K21 (Safety relay)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X16 (Intermediate connector). Check the circuit across A4.X2.94/91 and X16.16/10 for open or short circuit. Check the circuit across A4.X2.94/69 and X16.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across K21 (Safety relay) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1321-4: The starter relay has a short circuit to ground.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Monitoring only when the power stage is inactive. • ECU not in after-run, Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
	[Fault Detection] • Hardware reports a Short Circuit to Ground error on LS power stage for the starter relay actuator.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 90.00ms • Failure is detected if active for 25% of the time
Fault healing	• Hardware does not report a Short Circuit to Ground error on LS power stage for the starter relay actuator.

https://truckmanualshub.com/

System reaction		• Power stage shut off. • Further reactions according FID (see FID's)
		• 1) FId / Physical errors that could be detected when the Starter is in the Stopped state • 2) FId / Status of function identifier FId_EngDemTrqLimErr1 • 3) FId / Torque limitation 2 activated for power reduction • 4) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 5) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Short circuit of wiring to ground or defective LS starter relay
Failure repair		• Check of wiring or replacement of LS starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K21 (Safety relay). Check the circuit across A4.X2.94/91 and K21.5/3 for open or short circuit. Check the circuit across A4.X2.94/69 and K21.5/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "K21 (Safety relay)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X16 (Intermediate connector). Check the circuit across A4.X2.94/91 and X16.16/10 for open or short circuit. Check the circuit across A4.X2.94/69 and X16.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across K21 (Safety relay) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1321-12: The starter relay has an over temperature error.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Monitoring only when the power stage is active. • ECU not in after-run, Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
		[Fault Detection] • Hardware reports an excess temperature (OT) error on the LS power stage for starter relay actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1.00s 5.00- times in actual driving cycle. Failure healed, if the power stage does not report an OT error. Else no healing possible at this driving cycle.
System reaction		• Power stage shut off. • Further reactions according FID (see FID's)
		• 1) FId / Physical errors that could be detected when the Starter is in the Running state • 2) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• Check battery voltage, wiring, power stage and LS starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K21 (Safety relay). Check the circuit across A4.X2.94/91 and K21.5/3 for open or short circuit. Check the circuit across A4.X2.94/69 and K21.5/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "K21 (Safety relay)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X16 (Intermediate connector). Check the circuit across A4.X2.94/91 and X16.16/10 for open or short circuit. Check the circuit across A4.X2.94/69 and X16.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across K21 (Safety relay) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1322-12: Combustion misfiring has been detected.

Generation condition	[Test Condition] • By Data set MisfDet_stMonCondPatMsk: Monitoring not inhibited by FId_MisfDet due to another failure, Engine speed between 500.00rpm and 1100.00rpm, Fuel Quantity between 2.00mg/hub and 40.00mg/hub, Engine temperature > 19.96°C {67.93°F}, vehicle speed < 3km/h {1.9mph}, Engine running, Engine in running since start > 5.00s, Wheel slip < 1.00-, Wheel slip constant since 1000.00ms and Failure memory erased by Scan tool
	[Fault Detection] • A Cylinder is misfiring, when within a test frame of 25.00- blocks each composed of 12.00- evaluated engine rotations-i.e. totally 300 engine revolutions -, at least 120.00- misfires are detected. If more than 1 cylinder has misfiring, this failure path is set.
	[Defect Debouncing] • > 120.00- misfires
Fault healing	• No defect detection

https://truckmanualshub.com/

System reaction		• Irregular engine running • According FID (see FID's) • If less than 1.00- cylinders show misfiring: Failure paths of the defective cylinders also stored.
		• 1) FId / Inhibit OxiCat passive monitor • 2) FId / Inhibit DPF efficiency monitor • 3) FId / Interrupt DPF efficiency monitor • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF • 6) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Severe loss of compression or fuel injection failure
Failure repair		• If Failure Path for Misfiring of single cylinders are also stored: check the dedicated cylinders. • If no Failure path of Misfiring of single cylidner is stored (this means more than 1.00- show misfiring): check all cylinders for correct injection and or compression.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). Remove the connector of Y16 (Fuel injector 2). Remove the connector of Y17 (Fuel injector 3). Remove the connector of Y18 (Fuel injector 4). Check the circuit across Y15.2/1 and A4.X1.60/31 for open or short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Check the circuit across Y16.2/1 and A4.X1.60/17 for open or short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Check the circuit across Y17.2/1 and A4.X1.60/16 for open or short circuit. Check the circuit across Y17.2/2 and A4.X1.60/1 for open or short circuit. Check the circuit across Y18.2/1 and A4.X1.60/32 for open or short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control "Fuel injector". Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

1323-12: Combustion misfiring of cylinder 1 has been detected.

Generation condition		[Test Condition] • By Data set MisfDet_stMonCondPatMsk: Monitoring not inhibited by FId_MisfDet due to another failure, Engine speed between 500.00rpm and 1100.00rpm, Fuel Quantity between 2.00mg/hub and 40.00mg/hub, Engine temperature > 19.96°C {67.93°F}, vehicle speed < 3km/h {1.9mph}, Engine running, Engine in running since start > 5.00s, Wheel slip < 1.00-, Wheel slip constant since 1000.00ms and Failure memory erased by Scan tool
		[Fault Detection] • Cylinder 1 is misfiring, when within a test frame of 25.00- blocks each composed of 12.00- evaluated engine rotations -i.e. totally 300 engine revolutions -, at least 120.00- misfires are detected of cylinder 1.
		[Defect Debouncing] • 120.00- misfires
Fault healing		• A test frame with no defect detection for cylinder 1 is concluded.
System reaction		• Irregular engine running or idle • Only according FID (see FID's)
		• 1) FId / Inhibit OxiCat passive monitor • 2) FId / Inhibit DPF efficiency monitor • 3) FId / Interrupt DPF efficiency monitor • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF • 6) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Severe loss of compression or fuel injection failure
Failure repair		• Check the sealing of the combustion chamber (piston ring, cylinder head.), look for injection failures of cylinder 1
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y15 (Fuel injector 1)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5

1324-12: Combustion misfiring of cylinder 3 has been detected.

Generation condition		[Test Condition] • By Data set MisfDet_stMonCondPatMsk: Monitoring not inhibited by FId_MisfDet due to another failure, Engine speed between 500.00rpm and 1100.00rpm, Fuel Quantity between 2.00mg/hub and 40.00mg/hub, Engine temperature > 19.96°C {67.93°F}, vehicle speed < 3km/h {1.9mph}, Engine running, Engine in running since start > 5.00s, Wheel slip < 1.00-, Wheel slip constant since 1000.00ms and Failure memory erased by Scan tool
		[Fault Detection] • Cylinder 3 is misfiring, when within a test frame of 25.00- blocks each composed of 12.00- evaluated engine rotations -i.e. totally 300 engine revolutions -, at least 120.00- misfires are detected of cylinder 3.
		[Defect Debouncing] • 120.00- misfires
Fault healing		• A test frame with no defect detection for cylinder 3 is concluded.
System reaction		• Irregular engine running or idle • Only according FID (see FID’s)
		• 1) FId / Inhibit OxiCat passive monitor • 2) FId / Inhibit DPF efficiency monitor • 3) FId / Interrupt DPF efficiency monitor • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF • 6) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Severe loss of compression or fuel injection failure
Failure repair		• Check the sealing of the combustion chamber (piston ring, cylinder head.), look for injection failures of cylinder 3
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y17 (Fuel injector 3)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y17 (Fuel injector 3) which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5

1325-12: Combustion misfiring of cylinder 4 has been detected.

Generation condition	[Test Condition] • By Data set MisfDet_stMonCondPatMsk: Monitoring not inhibited by FId_MisfDet due to another failure, Engine speed between 500.00rpm and 1100.00rpm, Fuel Quantity between 2.00mg/hub and 40.00mg/hub, Engine temperature > 19.96°C {67.93°F}, vehicle speed < 3km/h {1.9mph}, Engine running, Engine in running since start > 5.00s, Wheel slip < 1.00-, Wheel slip constant since 1000.00ms and Failure memory erased by Scan tool
	[Fault Detection] • Cylinder 4 is misfiring, when within a test frame of 25.00- blocks each composed of 12.00- evaluated engine rotations -i.e. totally 300 engine revolutions -, at least 120.00- misfires are detected of cylinder 4.
	[Defect Debouncing] • 120.00- misfires
Fault healing	• A test frame with no defect detection for cylinder 4 is concluded.
System reaction	• Irregular engine running or idle • Only according FID (see FID’s)
	• 1) FId / Inhibit OxiCat passive monitor • 2) FId / Inhibit DPF efficiency monitor • 3) FId / Interrupt DPF efficiency monitor • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF • 6) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause	• Severe loss of compression or fuel injection failure
Failure repair	• Check the sealing of the combustion chamber (piston ring, cylinder head.), look for injection failures of cylinder 4

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y18 (Fuel injector 4)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5

1326-12: Combustion misfiring of cylinder 2 has been detected.

Generation condition	[Test Condition] • By Data set MisfDet_stMonCondPatMsk: Monitoring not inhibited by FId_MisfDet due to another failure, Engine speed between 500.00rpm and 1100.00rpm, Fuel Quantity between 2.00mg/hub and 40.00mg/hub, Engine temperature > 19.96°C {67.93°F}, vehicle speed < 3km/h {1.9mph}, Engine running, Engine in running since start > 5.00s, Wheel slip < 1.00-, Wheel slip constant since 1000.00ms and Failure memory erased by Scan tool
	[Fault Detection] • Cylinder 2 is misfiring, when within a test frame of 25.00- blocks each composed of 12.00- evaluated engine rotations -i.e. totally 300 engine revolutions -, at least 120.00- misfires are detected of cylinder 2.
	[Defect Debouncing] • 120.00- misfires
Fault healing	• A test frame with no defect detection for cylinder 2 is concluded.

https://truckmanualshub.com/

		• Irregular engine running or idle • Only according FID (see FID's)
System reaction		• 1) FId / Inhibit OxiCat passive monitor • 2) FId / Inhibit DPF efficiency monitor • 3) FId / Interrupt DPF efficiency monitor • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF • 6) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Severe loss of compression or fuel injection failure

https://truckmanualshub.com/

1442-3: Component 'Fuel metering unit' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet and while the engine isn't cranking • Monitoring only when the power stage is active • Battery voltage > 9.50V (switch off < 9.00V)
		[Fault Detection] • Hardware reports a Short Circuit to Battery error on power stage for Metering Unit at Low Side
		[Defect Debouncing] • Defect condition exceeded cumulatively > 220.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 200.00ms Hardware does not reports a Short Circuit to Battery error on power stage for Metering Unit Low Side
System reaction		• Power stage shut off. • Further reactions according FID (see FID's)
		• 1) FId / Reset Metering Unit adaption value • 2) FId / I Part of current governor of Metering Unit (MeUn) of Common Rail frozen • 3) FId / Check if continuous SCB or SCG or intermittent contact of Metering Unit (MeUn) of Common Rail active • 4) FId / Rotation function of Metering Unit (MeUn) of Common Rail in After-run disabled • 5) FId / Interrupt DPF efficiency monitor • 6) FId / Inhibit monitor for DPF frequent regeneration • 7) FId / Substitute reaction: In the event of an error, a regeneration is prevented or a currently-running regeneration is interrupted. • 8) FId / Inhibit monitor for incomplete regeneration of the DPF • 9) FId / Fuel pressure control exclusively made by metering unit (MeUn) in current driving cycle • 10) FId / Closed loop control of Fuel Rail pressure by metering unit MeUn disabled (control exclusively by pressure control valve) • 11) FId / Fuel flow at maximum delivery volume because of Metering Unit failure • 12) FId / Monitoring of positive deviation of fuel rail pressure (too low pressure) disabled • 13) FId / Status of function identifier FId_PFltLmp • 14) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Short circuit of wiring to battery or inside Metering Unit at Low Side
Failure repair		• Check of wiring, replace Metering Unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y10 (Pressure regulating valve in rail). Check the circuit across Y10.2/1 and A4.X1.60/30 for open or short circuit. Check the circuit across Y10.2/2 and A4.X1.60/60 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "Y10 (Pressure regulating valve in rail)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1442-4: Component 'Fuel metering unit' has a short circuit to ground.

Generation condition	[Test Condition] • Battery voltage > 9.50V (switch off < 9.00V)
	[Fault Detection] • Hardware reports a Short Circuit to Ground error on power stage for Metering Unit Low Side
	[Defect Debouncing] • Defect condition exceeded cumulatively > 280.00ms • Failure is detected if active for 25% of the time
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None except FIDs
	• 1) FId / Reset Metering Unit adaption value • 2) FId / I Part of current governor of Metering Unit (MeUn) of Common Rail frozen • 3) FId / Check if continuous SCB or SCG or intermittent contact of Metering Unit (MeUn) of Common Rail active • 4) FId / Rotation function of Metering Unit (MeUn) of Common Rail in After-run disabled • 5) FId / Interrupt DPF efficiency monitor • 6) FId / Inhibit monitor for DPF frequent regeneration • 7) FId / Substitute reaction: In the event of an error, a regeneration is prevented or a currently-running regeneration is interrupted. • 8) FId / Inhibit monitor for incomplete regeneration of the DPF • 9) FId / Fuel pressure control exclusively made by metering unit (MeUn) in current driving cycle • 10) FId / Closed loop control of Fuel Rail pressure by metering unit MeUn disabled (control exclusively by pressure control valve) • 11) FId / Fuel flow at maximum delivery volume because of Metering Unit failure • 12) FId / Monitoring of positive deviation of fuel rail pressure (too low pressure) disabled • 13) FId / Status of function identifier FId_PFltLmp • 14) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause	• Short circuit of wiring to ground or inside Metering Unit at Low Side
Failure repair	• Check of wiring, replace Metering Unit

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y10 (Pressure regulating valve in rail). Check the circuit across Y10.2/1 and A4.X1.60/30 for open or short circuit. Check the circuit across Y10.2/2 and A4.X1.60/60 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y10 (Pressure regulating valve in rail)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1442-5: Fuel metering unit Current below normal or Open circuit

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Monitoring only when the power stage is NOT active. • Battery voltage > 9.50V (switch off < 9.00V)
	[Fault Detection] • Hardware reports “open load” (OL) error
	[Defect Debouncing] • Defect condition exceeded cumulatively > 220.00ms • Failure is detected if active for 25% of the time
Fault healing	• Failure healed, if the power stage does not report an OL error.

https://truckmanualshub.com/

		• Power stage switched off, i.e.Full quantity is delivered to common rail, which can lead to an overshoot of fuel pressure (which can lead to open the mechanical pressure limiting valve, if present), or -in case of SCB on the MeUN - engine stops (no fuel delivery) • Further reactions according FID (see FID's)
System reaction		• 1) FId / I Part of current governor of Metering Unit (MeUn) of Common Rail frozen • 2) FId / Check if continuous SCB or SCG or intermittent contact of Metering Unit (MeUn) of Common Rail active • 3) FId / Rotation function of Metering Unit (MeUn) of Common Rail in After-run disabled • 4) FId / Fuel pressure control exclusively made by metering unit (MeUn) in current driving cycle • 5) FId / Closed loop control of Fuel Rail pressure by metering unit MeUn disabled (control exclusively by pressure control valve) • 6) FId / Fuel flow at maximum delivery volume because of Metering Unit failure • 7) FId / Monitoring of positive deviation of fuel rail pressure (too low pressure) disabled • 8) FId / Monitoring of positive deviation (too low pressure) combined with set value of pressure control valve enabled • 9) FId / Inhibit DPF efficiency monitor • 10) FId / Interrupt DPF efficiency monitor • 11) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 12) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 13) FId / Inhibit monitor for DPF frequent regeneration • 14) FId / Inhibit monitor for incomplete regeneration of the DPF • 15) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• Broken or disconnected wiring, defective metering unit
Failure repair		• Check of wiring or metering unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y10 (Pressure regulating valve in rail). Check the circuit across Y10.2/1 and A4.X1.60/30 for open or short circuit. Check the circuit across Y10.2/2 and A4.X1.60/60 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "Y10 (Pressure regulating valve in rail)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1442-12: Component 'Fuel metering unit' signals overtemperature.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Monitoring only when the power stage is active. • Battery voltage > 9.50V (switch off < 9.00V)
		[Fault Detection] • Hardware reports "overtemperature" (OT) error
		[Defect Debouncing] • Defect condition exceeded cumulatively > 220.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 0.20s. Failure healed, if the power stage does not report an OT error.
System reaction		• Power stage switched off, i.e.Full quantity is delivered to common rail, which can lead to an overshoot of fuel pressure (which can lead to open the mechanical pressure limiting valve, if present) • Further reactions according FID (see FID's)
		• 1) FId / I Part of current governor of Metering Unit (MeUn) of Common Rail frozen • 2) FId / Rotation function of Metering Unit (MeUn) of Common Rail in After-run disabled • 3) FId / Fuel pressure control exclusively made by metering unit (MeUn) in current driving cycle • 4) FId / Closed loop control of Fuel Rail pressure by metering unit MeUn disabled (control exclusively by pressure control valve) • 5) FId / Monitoring of positive deviation of fuel rail pressure (too low pressure) disabled • 6) FId / Monitoring of positive deviation (too low pressure) combined with set value of pressure control valve enabled • 7) FId / Inhibit DPF efficiency monitor • 8) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 9) FId / Interrupt DPF efficiency monitor • 10) FId / Inhibit monitor for DPF frequent regeneration • 11) FId / Inhibit monitor for incomplete regeneration of the DPF • 12) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• Check of wiring or metering unit
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y10 (Pressure regulating valve in rail). Check the circuit across Y10.2/1 and A4.X1.60/30 for open or short circuit. Check the circuit across Y10 and A4.X1.60/60 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y10 (Pressure regulating valve in rail)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1485-7: Defect Fault Check for ECU Main relay.Mechanical system not responding or out of adjustment

Generation condition		[Test Condition] • Once per driving cycle after the After-run.
		[Fault Detection] • Supply voltage not sinking 500.00ms after “shut off request” by ECU.
		[Defect Debouncing] • Immediate
Fault healing		• Proper opening of main relay in the coming driving cycles(without any abnormal delay after the request from System Control module).
System reaction		• The ECU is not disconnected from the battery voltage (except the vehicle is equipped with a “main electrical switch”), therefore an empty battery after a long stand still period is possible.
Failure cause		• Main relay has a short circuit or is mechanically stuck in closed position
Failure repair		• Check wiring or replace main relay
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/72 and A20.X9.14/5 for open or short circuit. Open or short circuit in the harness across A4.X2.94/82 and A20.X9.14/4 Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1485-31: ECU Main relay has an Early Opening failure.

Generation condition		[Test Condition] • Once at ECU initialisation.
		[Fault Detection] • If the bit in the EEPROM is detected as “set” directly after system start.
		[Defect Debouncing] • After 3.0 consecutive starts
Fault healing		• The bit is reset to 0 at the end of next afterrun, if closing of Main relay correct, i.e. healing at next start, if bit = 0.
System reaction		• New failures are not stored in the failure memory (and not visible to the tester) • Failure validation according driving cycles does not work (failure remains in “pending” state) • Failure healing not working (failure remains in “validated” or “healed” state) • Further reaction according FID (see FID’s)
Failure cause		• The Main Relay is switched off directly by Key 15 instead of the request of ECU: • in case vehicle equipped with “main electrical switch”: engine stopped by “main switch” instead of Key 15 OR Main switch disconnected before afterrun finished. • due to wrong wiring to the Main Relay (direct contact to the battery missing or wiring ECU to Main relay) • due to internal defect of ECU
Failure repair		• In case of vehicle equipped with “main electrical switch”: inform driver of correct engine shut off by Key 15. • In case of vehicle equipped with electronic “main electrical switch”: check electronic of main switch for correct working (if opens after afterrun finished) • Check wiring harness between main Relay and battery • Check wiring harness between ECU and Main Relay • Check ECU
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/72 and A20.X9.14/5 for open or short circuit. Open or short circuit in the harness across A4.X2.94/82 and A20.X9.14/4 Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1623-19: Cardan speed: Received network data is in error

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • Value of Com_nSpd is equal to VEHV_V_CANERR (0x7FFF) or Com_nTCO1CdrSPre is equal VEHV_V_CANERR (0x7FFF) or (Com_nCdrs is equal to 0RPM and Com_vVeh is less than 10km/h {6.2mph})
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Plausible cardan speed received

https://truckmanualshub.com/

System reaction		• None
		• 1) FId / Vehicle speed monitoring inhibited • 2) FId / Vehicle speed value (via CAN) replaced by substitute value if failure is validated • 3) FId / Status of function identifier FId_EngDemTrqLimErr1 • 4) FId / Torque limitation 4 activated for power reduction • 5) FId / Engine speed Limitation 1 for HIgh/Low engine speed (HLS) control active • 6) Fid / Cruise control immediately shut off • 7) FId / Multiple state switch error, PTO disabled • 8) FId / Vehicle speed sensing error, Cruise control disabled • 9) FId / Release of OBD Performance Limiter at low vehicle speed inhibited due to a failure • 10) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 11) FId / Plausibility Check Accelerator and brake pedal not released due to failure in vehicle speed evaluation • 12) FId / Inhibit Charged Air Cooler monitoring • 13) Fid / Crankshaft sensor diagnosis inhibited (due to vehicle speed implausibility, e.g. towed vehicle) • 14) FId / Vehicle speed assumed by engine speed and load for calculation of total driven distance of vehicle • 15) FId / Drive away-set point idle speed calculation by High/Low engine speed control (HLS) inhibited • 16) FId / Underbraking disabled for High and Low engine speed control (HLS) (no special control parameters in case of Underbraking used) • 17) FId / High and Low engine speed demand control (HLS) disabled • 18) FId / Single Injector shut off test inhibited • 19) FId / Compression test inhibited • 20) FId / Run up test which is used in diagnostic scheduler of DSM • 21) FId / Vehicle Speed signal defective, speed limiter blocked • 22) FId / Actuator test for Metering Unit (MeUn) of Common Rail disabled • 23) FId / Set point test of Metering Unit (MeUn) of Common Rail disabled • 24) FId / Misfire Detection disabled • 25) FId / Fuel rail pressure control valve (PCV) set point test inhibited • 26) FId / High pressure test inhibited • 27) FId / Closing of metering unit forced (full fuel feeding) • 28) FId / Rail Pressure set point test inhibited • 29) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 30) FId / Vehicle speed signal evaluation defective • 31) Fid / Fix Substitution value (FE) for actual fuel economy status transmit to CAN Message FIEco • 32) FId / Status of Function Identifier for Wheel Based Vehicle Speed • 33) FId / Coolant thermostat diagnosis disabled • 34) FId / Use of the gear signal for the range check of particulate filter (DPF) is inhibited • 35) FId / Use of the vehicle speed for the range check of particulate filter (DPF) is inhibited • 36) FId / Vehicle speed sensor defective, PGNRQ can message invalid • 37) FId / Cooling fan speed set point calculation does not take into consideration vehicle speed (fix value Fans_vSubst_C used)
Failure cause		• Sensor connected via CAN announces not valid signal
Failure repair		• Check sensor
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A28 (DUONIC Control unit) side system.

https://truckmanualshub.com/

1624-19: Vehicle speed signal: Received network data is in error

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • The CAN message for vehicle speed reports an error: • Com_vVeh == 0x3FFF • or the message for cardan shaft speed reports an error Com_nCdrS == 0x3FFF
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The CAN message for vehicle speed and cardan shaft speed reports a valid value
System reaction	• None except FIDs. • Replacement value veh.speed = 0km/h {0mph} • Replacement value cardan shaft speed = 0.00rpm
	• 1) FId / Vehicle speed monitoring inhibited • 2) FId / Vehicle speed value (via CAN) frozen in case of preliminary failure detected • 3) FId / Vehicle speed value (via CAN) replaced by substitute value if failure is validated • 4) FId / Status of function identifier FId_EngDemTrqLimErr1 • 5) FId / Torque limitation 4 activated for power reduction • 6) FId / Engine speed Limitation 1 for HIgh/Low engine speed (HLS) control active • 7) Fid / Cruise control immediately shut off • 8) FId / Multiple state switch error, PTO disabled • 9) FId / Vehicle speed sensing error, Cruise control disabled • 10) FId / Release of OBD Performance Limiter at low vehicle speed inhibited due to a failure • 11) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 12) FId / Plausibility Check Accelerator and brake pedal not released due to failure in vehicle speed evaluation • 13) FId / Inhibit Charged Air Cooler monitoring • 14) Fid / Crankshaft sensor diagnosis inhibited (due to vehicle speed implausibility, e.g. towed vehicle) • 15) FId / Vehicle speed assumed by engine speed and load for calculation of total driven distance of vehicle • 16) FId / Drive away-set point idle speed calculation by High/Low engine speed control (HLS) inhibited • 17) FId / Underbraking disabled for High and Low engine speed control (HLS) (no special control parameters in case of Underbraking used) • 18) FId / High and Low engine speed demand control (HLS) disabled • 19) FId / Vehicle Speed signal defective, speed limiter blocked • 20) FId / Misfire Detection disabled • 21) FId / Closing of metering unit forced (full fuel feeding) • 22) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 23) FId / Vehicle speed signal evaluation defective • 24) Fid / Fix Substitution value (FE) for actual fuel economy status transmit to CAN Message FIEco • 25) FId / Status of Function Identifier for Wheel Based Vehicle Speed • 26) FId / Coolant thermostat diagnosis disabled • 27) FId / Use of the gear signal for the range check of particulate filter (DPF) is inhibited • 28) FId / Use of the vehicle speed for the range check of particulate filter (DPF) is inhibited • 29) FId / Vehicle speed sensor defective, PGNRQ can message invalid • 30) FId / Cooling fan speed set point calculation does not take into consideration vehicle speed (fix value Fans_vSubst_C used)
Failure cause	• Defective or incorrect functioning of vehicle speed measuring device
Failure repair	• Check speed measuring device for proper functioning

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A28 (DUONIC Control unit) side system.

1624-31: Vehicle speed source and HRWS replacement defect

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded and if the ECU is not in after-run • Signal source is CAN (1.00- = CONNECT_CAN(1))
	[Fault Detection] • (Com_vFrntLWhlSpd is equal to VEHV_V_CANERR (0x7FFF) and Com_vFrntRWhlSpd is equal VEHV_V_CANERR (0x7FFF)) and (Com_vRearLWhlSpd is equal VEHV_V_CANERR (0x7FFF) and Com_vRearRWhlSpd is equal to VEHV_V_CANERR (0x7FFF)) or DINH_stFId.FId_HRWSTO is inhibited
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Valid wheel speed signal received
System reaction	• None except FIDs
	• 1) FId / Vehicle speed monitoring inhibited • 2) FId / Vehicle speed value (via CAN) frozen in case of preliminary failure detected • 3) FId / Vehicle speed value (via CAN) replaced by substitute value if failure is validated • 4) FId / Status of function identifier FId_EngDemTrqLimErr1 • 5) FId / Torque limitation 4 activated for power reduction • 6) FId / Engine speed Limitation 1 for HIgh/Low engine speed (HLS) control active • 7) Fid / Cruise control immediately shut off • 8) FId / Multiple state switch error, PTO disabled • 9) FId / Vehicle speed sensing error, Cruise control disabled • 10) FId / Release of OBD Performance Limiter at low vehicle speed inhibited due to a failure • 11) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 12) FId / Plausibility Check Accelerator and brake pedal not released due to failure in vehicle speed evaluation • 13) FId / Inhibit Charged Air Cooler monitoring • 14) Fid / Crankshaft sensor diagnosis inhibited (due to vehicle speed implausibility, e.g. towed vehicle) • 15) FId / Vehicle speed assumed by engine speed and load for calculation of total driven distance of vehicle • 16) FId / Drive away-set point idle speed calculation by High/Low engine speed control (HLS) inhibited • 17) FId / Underbraking disabled for High and Low engine speed control (HLS) (no special control parameters in case of Underbraking used) • 18) FId / High and Low engine speed demand control (HLS) disabled • 19) FId / Vehicle Speed signal defective, speed limiter blocked • 20) FId / Misfire Detection disabled • 21) FId / Closing of metering unit forced (full fuel feeding) • 22) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 23) FId / Vehicle speed signal evaluation defective • 24) Fid / Fix Substitution value (FE) for actual fuel economy status to CAN Message FIEco • 25) FId / Status of Function Identifier for Wheel Based Vehicle Speed • 26) FId / Coolant thermostat diagnosis disabled • 27) FId / Use of the gear signal for the range check of particulate filter (DPF) is inhibited • 28) FId / Use of the vehicle speed for the range check of particulate filter (DPF) is inhibited • 29) FId / Vehicle speed sensor defective, PGNRQ can message invalid • 30) FId / Cooling fan speed set point calculation does not take into consideration vehicle speed (fix value Fans_vSubst_C used)
Failure cause	• Wheel speed sensor defective

https://truckmanualshub.com/

Failure repair		• Check wheel speed sensor
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

1633-9: CAN Timeout Error during CAN-Transmit-Frame Cruise Control Parameters from ATM controller.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Timeout of CCVSTM message is detected
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the CCVSTM message is received correct, after the debouncing time the DFC is healed
System reaction		• Cruise control is inhibited
Failure cause		• Defective CAN controller of AMT, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the AMT to the network, Check correct functioning of the CAN controller. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with A28 (DUONIC Control unit) is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of A28 (DUONIC Control unit). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

1636-0: Signal Range Check (SRC) for 'Air Flow Sensor' reports HIGH.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • The sensor raw signal Air_uRawTAFS (voltage) is above 4.93V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensor raw signal Air_uRawTAFS (voltage) is below or equal to 4.93V

https://truckmanualshub.com/

System reaction		• Temperature ramps to fixed replacement value 29.96°C {85.93°F} using slope 3.00K/s or 3.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) FId / Freeze last valid value if failure is preliminary set • 2) FId / Inhibit physical range check on the sensed value of the intake air temperature sensor. • 3) FId / Set replacement value if failure is validated • 4) FId / Inhibit temperature sampling • 5) FId / Inhibit Charged Air Cooler monitoring • 6) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B18 (Air flow and intake air temperature sensor)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9

Inspection procedure	Step8	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1636-1: Signal Range Check (SRC) for 'Air Flow Sensor' reports LOW.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The sensor raw signal Air_uRawTAFS (voltage) is below 295.40mV
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensor raw signal Air_uRawTAFS (voltage) is above or equal to 295.40mV
System reaction		• Temperature ramps to fixed replacement value 29.96°C {85.93°F} using slope 3.00K/s or 3.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) FId / Freeze last valid value if failure is preliminary set • 2) FId / Inhibit physical range check on the sensed value of the intake air temperature sensor. • 3) FId / Set replacement value if failure is validated • 4) FId / Inhibit temperature sampling • 5) FId / Inhibit Charged Air Cooler monitoring • 6) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1636-16: Component ‘Charge air temperature sensor’ is thermally overloaded.

Generation condition	[Test Condition] • Signal is tested if FId_TAFSPhysRng is not inhibited by another failure. • Continuously.
	[Fault Detection] • The sensed sensor signal Air_tSensTAFS is greater than 99.96°C {211.93°F}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensed sensor signal Air_tSensTAFS is below 99.96°C {211.93°F}

https://truckmanualshub.com/

System reaction		• Temperature ramps to fixed replacement value 29.96°C {85.93°F} using slope 3.00K/s or 3.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) FId / Freeze last valid value if failure is preliminary set • 2) FId / Set replacement value if failure is validated • 3) FId / Inhibit Charged Air Cooler monitoring • 4) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• Inaccurate or defective air temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the air temperature sensor and replace it if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component "B18 (Air flow and intake air temperature sensor)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

1675-2: ECU Key 16Defective switch T50-

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The debounced signal is high (T50_st == 1) for a period longer than debounce time
		[Defect Debouncing] • Defect condition exceeded cumulatively > 30.00s • Failure is detected if active for 50% of the time
Fault healing		• The debounced signal is low (T50_st == 0) for a period longer than debounce time
System reaction		• None
Failure cause		• Too long cranking request, short circuit in ignition key module or in wiring
Failure repair		• Check ignition key module and wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K21 (Safety relay). Check the circuit across A4.X2.94/91 and K21.5/3 for open or short circuit. Check the circuit across A4.X2.94/69 and K21.5/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “K21 (Safety relay)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X16 (Intermediate connector). Check the circuit across A4.X2.94/91 and X16.16/10 for open or short circuit. Check the circuit across A4.X2.94/69 and X16.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across K21 (Safety relay) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X16 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1761-2: The value of component ‘SCR Reagent tank level sensor’ is implausible.Data erratic, intermittent or incorrect

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously if the DEF tank content is not frozen (UHC_stCTL==1)
	[Fault Detection] • The Level < 38.00%.
	[Defect Debouncing] • Defect condition fulfilled continuously >3000.0 ms
Fault healing	• The Level > 38.00%.
System reaction	• Only according FID (see FID’s)
	• 1) FId / Freeze DEF tank level if preliminary failure detected • 2) FId / Set replacement value for DEF Tank Level if confirmed failure detected

https://truckmanualshub.com/

Failure cause		• DEF Level Sensor defect
Failure repair		• Check and Replace Sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A19 (DEF fill level sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/85 and A19.X1.3/2 for open or short circuit. Check the circuit across A4.X2.94/31 and A19.X1.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and A19.X1.3/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “A19 (DEF fill level sensor)”. Reinstall all the removed connectors. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19 (Intermediate connector). Remove the connector of A20 (SAM). Repair or replace the harness across A20.X10.14/2 and X19.16/8. Repair or replace the harness across A4.X2.94/31 and X19.16/16. Repair or replace the harness across A4.X2.94/85 and X19.16/15. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Repair or replace the harness across A19 (Def fill level sensor) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19 (Intermediate connector). Repair or replace the harness across A20 (SAM) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

1761-12: Defect Fault Check for SCR Reagent tank level sensor.Bad intelligent device or component

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously if the tank content is not frozen (UHC_stCTL==1)
		[Fault Detection] • The Level between 38.00% and 48.00%.
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• According FID (see FID's)
		• 1) FId / Freeze DEF tank level if preliminary failure detected • 2) FId / Set replacement value for DEF Tank Level if confirmed failure detected
Failure cause		• Sensor Defect
Failure repair		• Check Sensor and replace it if not OK
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A19 (DEF fill level sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/85 and A19.X1.3/2 for open or short circuit. Check the circuit across A4.X2.94/31 and A19.X1.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and A19.X1.3/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "A19 (DEF fill level sensor)". Reinstall all the removed connectors. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19 (Intermediate connector). Remove the connector of A20 (SAM). Repair or replace the harness across A20.X10.14/2 and X19.16/8. Repair or replace the harness across A4.X2.94/31 and X19.16/16. Repair or replace the harness across A4.X2.94/85 and X19.16/15. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Repair or replace the harness across A19 (DEF fill level sensor) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19 (Intermediate connector). Repair or replace the harness across A20 (SAM) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

1761-31: SCR Reagent Tank level sensor has a monitoring error.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • continuously, it DEF tank not frozen.
		[Fault Detection] • No Signal change between “all sensor wet” and “all sensors dry” within 100.00s. • OR • Raw PWM Signal not between 15.00% and 85.00%.
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• Signal change between “all sensor wet” and “all sensors dry” within 100.00s. • AND • Raw PWM Signal between 15.00% and 85.00%.
System reaction		• According FID (see FID’s)
		• 1) FId / Freeze DEF tank level if preliminary failure detected • 2) FId / Set replacement value for DEF Tank Level if confirmed failure detected • 3) FId / Status of function Identifier FID_UTnkLvlPlausErr
Failure cause		• Sensor Supply defect • Wiring harness defect • Sensor defect
Failure repair		• Check wiring harness • Check Sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A19 (DEF fill level sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/85 and A19.X1.3/2 for open or short circuit. Check the circuit across A4.X2.94/31 and A19.X1.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and A19.X1.3/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “A19 (DEF fill level sensor)”. Reinstall all the removed connectors. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19 (Intermediate connector). Remove the connector of A20 (SAM). Repair or replace the harness across A20.X10.14/2 and X19.16/8. Repair or replace the harness across A4.X2.94/31 and X19.16/16. Repair or replace the harness across A4.X2.94/85 and X19.16/15. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Repair or replace the harness across A19 (DEF fill level sensor) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19 (Intermediate connector). Repair or replace the harness across A20 (SAM) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

2623-3: Accelerator pedalAPP2: Voltage above normal or shorted to high source

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Continuously.
	[Fault Detection] • If the signal exceeds the applicable threshold 3.70V, a signal range violation is detected. • Error is entered only if the signal path is not classified as defective (DINH_stFId.FId_APP2SigPath not set by another failure).
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time

https://truckmanualshub.com/

Fault healing		• If the signal is below the applicable threshold 3.70V, the signal range violation is reset after the healing debouncing.
System reaction		• No substitute value is formed in the device driver. The read in signal is relayed unchanged to the layers above it.
		• 1) FId / SRC high on APP2 detected --> APP2 Signal not useable • 2) FId / Status of function identifier FId_EngDemTrqLimErr1 • 3) FId / Torque limitation 2 activated for power reduction • 4) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Short circuit of wiring to external source or inside accelerator pedal
Failure repair		• Check wiring and accelerator pedal
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B17 (Position sensor Accelerator pedal). Check the circuit across A4.X2.94/30 and B17.6/5 for open or short circuit. Check the circuit across A4.X2.94/57 and B17.6/4 for open or short circuit. Check the circuit across A4.X2.94/45 and B17.6/6 for open or short circuit. Check the circuit across A4.X2.94/8 and B17.6/2 for open or short circuit. Check the circuit across A4.X2.94/35 and B17.6/1 for open or short circuit. Check the circuit across A4.X2.94/46 and B17.6/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B17 (Position sensor Accelerator pedal)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X17 (Intermediate connector). Check the circuit across A4.X2.94/45 and X16.16/1 for open or short circuit. Check the circuit across A4.X2.94/46 and X16.16/5 for open or short circuit. Check the circuit across A4.X2.94/57 and X16.16/2 for open or short circuit. Check the circuit across A4.X2.94/35 and X16.16/6 for open or short circuit. Check the circuit across A4.X2.94/30 and X16.16/2 for open or short circuit. Check the circuit across A4.X2.94/8 and X16.16/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across B17 (Position sensor Accelerator pedal) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2623-4: Accelerator pedalAPP2: Voltage below normal or shorted to low source

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Continuously.
		[Fault Detection] • If the signal is below the applicable threshold 270.00mV, a signal range violation is detected. • Error is entered only if the signal path is not classified as defective (DINH_stFId.FId_APP1SigPath not set by another failure).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal exceeds the applicable threshold 270.00mV, the signal range violation is reset after the healing debouncing.
System reaction		• No substitute value is formed in the device driver. The read in signal is relayed unchanged to the layers above it.
		• 1) FId / SRC high on APP2 detected --> APP2 Signal not useable • 2) FId / Status of function identifier FId_EngDemTrqLimErr1 • 3) FId / Torque limitation 2 activated for power reduction • 4) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Short circuit to ground in wiring or in accelerator pedal
Failure repair		• Check wiring or replace accelerator pedal
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B17 (Position sensor Accelerator pedal). Check the circuit across A4.X2.94/30 and B17.6/5 for open or short circuit. Check the circuit across A4.X2.94/57 and B17.6/4 for open or short circuit. Check the circuit across A4.X2.94/45 and B17.6/6 for open or short circuit. Check the circuit across A4.X2.94/8 and B17.6/2 for open or short circuit. Check the circuit across A4.X2.94/35 and B17.6/1 for open or short circuit. Check the circuit across A4.X2.94/46 and B17.6/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B17 (Position sensor Accelerator pedal)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X17 (Intermediate connector). Check the circuit across A4.X2.94/45 and X16.16/1 for open or short circuit. Check the circuit across A4.X2.94/46 and X16.16/5 for open or short circuit. Check the circuit across A4.X2.94/57 and X16.16/2 for open or short circuit. Check the circuit across A4.X2.94/35 and X16.16/6 for open or short circuit. Check the circuit across A4.X2.94/30 and X16.16/2 for open or short circuit. Check the circuit across A4.X2.94/8 and X16.16/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across B17 (Position sensor Accelerator pedal) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X17 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2630-2: The efficiency of the charge air cooler is not sufficient.

Generation condition		[Test Condition] • fnrFunctionMaskDescription(31.00-; Monitoring of the charge-air cooler is only carried out if; vehicle speed > 40km/h {24.86mph}; air mass flow is within the thresholds CACIg_dmThresHi_mp and 75.00Kg/h; engine temperature > 47.96°C {118.33°F}; pressure ratio at the compressor CACIg_rPres_mp > 1.25-; Exhaust flap ExhFlpLp_rActr is within the thresholds 110.00% • and 90.00%; control value of the cooler bypass valve CABVlv_r is within the thresholds 399.99% and 0.00%; release time of monitoring < 3.67min)
		[Fault Detection] • The calculated cooler efficiency CACIg_etaFlt_mp is below the threshold value CACIg_etaThres_mp based on fix value 0.50- plus a temperature dependent correction from curve 0.00- at 18.96°C {66.13°F}
		[Defect Debouncing] • Monitoring release time > 3.67min
Fault healing		• The calculated cooler efficiency CACIg_etaFlt_mp is above the threshold value CACIg_etaThres_mp based on fix value 0.50- plus a temperature dependent correction from curve 0.00- at 18.96°C {66.13°F}
System reaction		• None
Failure cause		• Charge air-cooler defective
Failure repair		• Check charge-air cooler
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

2791-0: Signal Range Check (SRC) for 'Sensor voltage EGR valve position' reports HIGH.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring not inhibited by FId_EGRVlvSSpMon set by another failure. • Continuously.
	[Fault Detection] • The sensor raw signal EGRVlv_uRaw (voltage) is above 4.80V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensor raw signal EGRVlv_uRaw (voltage) is less than or equal to 4.80V

https://truckmanualshub.com/

System reaction		• EGR valve position is frozen at last valid value on preliminary failure and ramps, using slope 1000.00%/s or 1000.00%/s depending whether the measured value is above or below replacement value, to a default value of 0.00% if failure is validated. • Further reactions according FID (see FID's)
		• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) FId / Last valid value for EGR Valve position is frozen • 6) FId / EGR valve closed loop governor and monitoring shut off • 7) FId / EGR Valve offset learning inhibited • 8) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 9) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 10) FId / Inhibit DPF monitor • 11) FId / Particulate filter ((DPF) Regeneration inhibited • 12) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 15) FID / Drift compensation of Air flow meter (HFM/AFS) disabled • 16) FId / Inhibit EGR cooler efficiency monitoring • 17) FId / Status of function identifier FId_EngDemTrqLimErr5 • 18) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Short circuit of wiring to external source or defective EGR valve position sensor
Failure repair		• Check of wiring or replace EGR valve position sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control "Control of exhaust gas recirculation". Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-1: Signal Range Check (SRC) for ‘Sensor voltage EGR valve position’ reports LOW.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring not inhibited by FId_EGRVlvSSpMon set by another failure. • Continuously.
	[Fault Detection] • The sensor raw signal EGRVlv_uRaw (voltage) is below 200.00mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensor raw signal EGRVlv_uRaw (voltage) is above or equal to 200.00mV

https://truckmanualshub.com/

System reaction		• EGR valve position is frozen at last valid value on preliminary failure and ramps, using slope 1000.00%/s or 1000.00%/s depending whether the measured value is above or below replacement value, to a default value of 0.00% if failure is validated. • Further reactions according FID (see FID's)

2791-5: EGR Valve has a Open Load of H-bridge.Current below normal or Open circuit

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring is carried out only once a driving cycle, in following conditions: • During After-run • During normal operation: only if Jammed valve error (EGRVlvJamVlv) active. • Testing is carried out for 610.00ms (system start or during engine running) or 1000.00ms (in after-run). During Testing the power stage is switched off
	[Fault Detection] • Hardware reports an “open load” (OL) error
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time
Fault healing	• Test is repeated until Hardware does no more report an “open load” error. In afterrun the test time is limited to 1000.00ms.

https://truckmanualshub.com/

System reaction		• Power stage is switched off by disabling the TLE7209/CJ230 chip --> EGR Valve actuation “off” • Further reaction according FID (see FID’s)
		• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) FId / EGR valve closed loop governor and monitoring shut off • 6) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 7) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 8) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 9) Fid / Boost pressure pre control correction depending on EGR disabled • 10) FId / Inhibit DPF monitor • 11) FId / Particulate filter ((DPF) Regeneration inhibited • 12) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 15) FID / Drift compensation of Air flow meter (HFM/AFS) disabled • 16) FId / Inhibit EGR cooler efficiency monitoring • 17) FId / Status of function identifier FId_EngDemTrqLimErr5 • 18) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Electrical problem of the EGR valve actuator: broken wiring harness, no contact of connector, internal broken line in actuator
Failure repair		• Check wiring harness on open circuit • Check EGR valve actuator on open circuit
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-7: EGR Valve is jammed in closed state.Mechanical system not responding or out of adjustment

Generation condition	[Test Condition] • After a governor deviation is detected
	[Fault Detection] • Jammed valve in closed state is detected if: • If permanent control deviation exist for a time greater than 300.00ms • Valve release attempts have failed (5.00- trials) • EGR actuator position is > 15.00%
	[Defect Debouncing] • 300.00ms after last release trial
Fault healing	• Healing not possible in same driving cycle, when fault condition don’t subsists (governor deviation healed or release succeeds)
System reaction	• Timer for repeated release function becomes active and the governor is shutoff.
	• 1) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 2) FId / EGR switched off • 3) FId / Deactivates NOx monitoring • 4) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 5) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 6) Fid / Boost pressure pre control correction depending on EGR disabled • 7) FId / Particulate filter ((DPF) Regeneration inhibited • 8) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 9) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 10) FId / Inhibit EGR cooler efficiency monitoring • 11) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 12) FID / Drift compensation of Air flow meter (HFM/AFS) disabled • 13) FId / Status of function identifier FId_EngDemTrqLimErr5 • 14) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active

https://truckmanualshub.com/

Failure cause		• EGR valve can not be opened as desired within expected time • EGR valve blocked mechanically • EGR valve sticks • EGR valve position sensor mismatched
Failure repair		• Check Functionality of EGR valve and the corresponding position
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

https://truckmanualshub.com/

2791-12: EGR Valve has Over temperature of H-bridge.Bad intelligent device or component

Generation condition		[Test Condition] • Monitoring only when the power stage is active. • If open load monitoring not active. • If the plausible test for short circuit overload not active.
		[Fault Detection] • Over Temperature of TLE7209/CJ230 error
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, the power stage is enabled each 150.00ms during defect recognition and 300.00ms after definitive failure recognition. • Healing if Hardware does not report “Over temperature” failure.
System reaction		• Power stage is switched off by disabling the TLE7209/CJ230 chip and the PWM output set to 0%. • Further reaction according FID (see FID’s)
		• 1) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 2) FId / EGR switched off • 3) FId / Deactivates NOx monitoring • 4) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / EGR valve closed loop governor and monitoring shut off • 7) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 8) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 9) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 10) Fid / Boost pressure pre control correction depending on EGR disabled • 11) FId / Inhibit DPF monitor • 12) FId / Particulate filter ((DPF) Regeneration inhibited • 13) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 14) FId / Inhibit EGR cooler efficiency monitoring • 15) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 16) FId / Status of function identifier FId_EngDemTrqLimErr5 • 17) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 18) FID / Drift compensation of Air flow meter (HFM/AFS) disabled
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• No reaction needed if failure isn’t present again after short time, check load and output, check wiring, replace ECU
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-16: Signal Range Check (SRC) for ‘EGR valve position’ reports HIGH.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Every time the actuator is at fully open or fully closed position.
	[Fault Detection] • If in open position 4.60V < sensed position voltage < 4.80V or in closed position 1000.00mV < sensed position voltage < 4.80V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Position in range

https://truckmanualshub.com/

System reaction		• None except FIds
		• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 6) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 7) FId / Inhibit DPF monitor • 8) FId / Particulate filter ((DPF) Regeneration inhibited • 9) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 10) FId / Inhibit EGR cooler efficiency monitoring • 11) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 12) FId / Status of function identifier FId_EngDemTrqLimErr5 • 13) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 14) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 15) FID / Drift compensation of Air flow meter (HFM/AFS) disabled
Failure cause		• EGR valve position sensor gives higher values than maximum due to electrical problems (“short circuit”) or position sensor mismatch
Failure repair		• Check wiring harness • Check EGR valve position sensor electrically • Check correct position in closed (0%) and fully opened (100%) position
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-18: Signal Range Check (SRC) for 'EGR valve position' reports LOW.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Every time the actuator is at fully open or fully closed position.
	[Fault Detection] • If in open position 4.00V > sensed position voltage > 200.00mV or in closed position 400.00mV > sensed position voltage Y 200.00mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Position in range
System reaction	• None except FIds
	• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 6) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 7) FId / Inhibit DPF monitor • 8) FId / Particulate filter ((DPF) Regeneration inhibited • 9) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 10) FId / Inhibit EGR cooler efficiency monitoring • 11) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 12) FId / Status of function identifier FId_EngDemTrqLimErr5 • 13) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 14) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 15) FID / Drift compensation of Air flow meter (HFM/AFS) disabled
Failure cause	• EGR valve position sensor gives lower values than minimum due to electrical problems ("short circuit") or position sensor mismatch
Failure repair	• Check wiring harness • Check EGR valve position sensor electrically • Check correct position in closed (0%) and fully opened (100%) position

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-31: EGR Valve has a limited current.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • If actuator current is set at its limit value, of 1.76 A for longer than debounce time.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00s • Failure is detected if active for 50% of the time

https://truckmanualshub.com/

Fault healing		• If actuator current is below its limit value, of 1.76 A for longer than debounce time.
System reaction		• None excepted Fids
		• 1) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 2) FId / Inhibit DPF monitor • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 5) FID / Drift compensation of Air flow meter (HFM/AFS) disabled
Failure cause		• EGR Valve actuation current is higher than allowed to reach the desired position: possibly electrical problem inside EGR Valve actuator or wiring harness (“short” circuit) or mechanical sticking of valve
Failure repair		• Check EGR valve electric circuit • Check mechanical EGR valve functionality
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2797-2: The DC/DC converter of Injector (Cylinder Bank 1) shuts off.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Buffer capacitor of bank 0 cannot be charged
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• Shut-off of Bank 0 • See FIds list for further reaction
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Injector bank shut off • 3) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 4) FId / Redundant Engine shut off path not tested due to error of an injector • 5) FId / Redundant Engine shut off path test inhibited • 6) FId / Inhibit DPF monitor • 7) FId / Misfire Detection disabled • 8) FId / Inhibit OxiCat passive monitor • 9) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Buffer capacitor cannot be charged, problem can be located in the capacitor or the power stage itself.
Failure repair		• Check presence of other failures connected to injector supply (short circuit), check capacitor, replace ECM if power stage is responsible.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

2797-3: Component 'charge switch of Injector (Cylinder Bank 0)' has a short circuit.

Generation condition	[Test Condition] • When system is switched on, after the buffer capacitor is loaded.
	[Fault Detection] • If the measured pattern for the evaluation of injector bank 0 is equal to applied behaviour bit pattern for short circuit error detection.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 50% of events
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

		• None except FIDs.
System reaction		• 1) FId / Fuel quantity set to (= engine stop) • 2) FId / Fuel pressure set to minimum (= engine stop) • 3) FId / Engine torque forced to (=engine stop) • 4) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 5) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 6) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 7) FId / Nominal Voltage Calibration NVC of injectors disabled • 8) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 9) FId / Redundant Engine shut off path not tested due to error of an injector • 10) FId / Redundant Engine shut off path test inhibited • 11) FId / Inhibit DPF monitor • 12) FId / Misfire Detection disabled • 13) FId / Inhibit OxiCat passive monitor • 14) FId / Shut Off Injector Bank 1 • 15) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Short circuit in wiring or injector connected to bank 0
Failure repair		• Check the wiring and injectors connected to bank 0.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). Remove the connector of Y18 (Fuel injector 4). Check the circuit across Y15.2/1 and A4.X1.60/31 for open or short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Check the circuit across Y18.2/1 and A4.X1.60/32 for open or short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

2797-6: The fuel injector (cylinder 0) has a short circuit.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • If the measured pattern for the evaluation of injector bank 0 is equal to applied behaviour bit pattern for short circuit error detection.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None except FIDs.
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 3) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 4) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 5) FId / Injector bank shut off • 6) FId / Nominal Voltage Calibration NVC of injectors disabled • 7) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 8) FId / Redundant Engine shut off path not tested due to error of an injector • 9) FId / Redundant Engine shut off path test inhibited • 10) FId / Inhibit DPF monitor • 11) FId / Particulate filter (DPF) regeneration not possible due to general system failure • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) FId / Misfire Detection disabled • 15) FId / Inhibit OxiCat passive monitor • 16) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Short circuit in wiring or injector connected to bank 0
Failure repair		• Check the wiring and injectors connected to bank 0.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). Remove the connector of Y18 (Fuel injector 4). Check the circuit across Y15.2/1 and A4.X1.60/31 for open or short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Check the circuit across Y18.2/1 and A4.X1.60/32 for open or short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

2797-12: The DC/DC converter of Injector (Cylinder Bank 1) can not stop.

Generation condition		[Test Condition] • Each time that an attempt is made to switch off a DC/DC converter.
		[Fault Detection] • The bank DC/DC converter cannot be switched off.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 25% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None except FIDs
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Injector bank shut off • 3) FId / Misfire Detection disabled • 4) FId / Inhibit OxiCat passive monitor • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• DC/DC converter cannot be shut off
Failure repair		• Check presence of other failures connected to injector supply (short circuit), check capacitor, replace ECM if power stage is responsible.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

2797-31: ECM internal failure of Injector actuation (chip error).

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • If the measured pattern for the chip evaluation IVDia_stErrClctChp_mp contents one of the following situation (in Dataset by IVDia_stDFCChp): max charging time exceeded, Differential current in piezo shunt exceeded, Cyl 1 not plausible, Cyl 2 not plausible, Cyl 3 not plausible, Cyl 4 not plausible and Cyl 5 not plausible
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing		• as soon as the error is detected.
System reaction		• None except FIDs.
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Nominal Voltage Calibration NVC of injectors disabled • 3) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 4) FId / Redundant Engine shut off path not tested due to error of an injector • 5) FId / Redundant Engine shut off path test inhibited • 6) FId / Misfire Detection disabled • 7) FId / Inhibit OxiCat passive monitor • 8) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Defective ECM
Failure repair		• Replace ECM
Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

2798-2: The DC/DC converter of Injector (Cylinder Bank 2) shuts off.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Buffer capacitor of bank 1 cannot be charged
	[Defect Debouncing] • Immediate
Fault healing	• None

https://truckmanualshub.com/

		• Shut-off of Bank 1 • See FIds list for further reaction
System reaction		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Injector bank 1 shut off • 3) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 4) FId / Redundant Engine shut off path not tested due to error of an injector • 5) FId / Redundant Engine shut off path test inhibited • 6) FId / Inhibit DPF monitor • 7) FId / Misfire Detection disabled • 8) FId / Inhibit OxiCat passive monitor • 9) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Buffer capacitor cannot be charged, problem can be located in the capacitor or the power stage itself.
Failure repair		• Check presence of other failures connected to injector supply (short circuit), check capacitor, replace ECM if power stage is responsible.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

2798-3: Component ‘charge switch of Injector (Cylinder Bank 1)’ has a short circuit.

Generation condition	[Test Condition] • When system is switched on, after the buffer capacitor is loaded.
	[Fault Detection] • If the measured pattern for the evaluation of injector bank 1 is equal to applied behaviour bit pattern for short circuit error detection.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 50% of events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None except FIDs.
	• 1) FId / Fuel quantity set to (= engine stop) • 2) FId / Fuel pressure set to minimum (= engine stop) • 3) FId / Engine torque forced to (=engine stop) • 4) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 5) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 6) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 7) FId / Nominal Voltage Calibration NVC of injectors disabled • 8) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 9) FId / Redundant Engine shut off path not tested due to error of an injector • 10) FId / Redundant Engine shut off path test inhibited • 11) FId / Inhibit DPF monitor • 12) FId / Misfire Detection disabled • 13) FId / Inhibit OxiCat passive monitor • 14) FId / Shut Off Injector Bank 2 • 15) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)

https://truckmanualshub.com/

Failure cause		• Short circuit in wiring or injector connected to bank 1
Failure repair		• Check the wiring and injectors connected to bank 1
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y16 (Fuel injector 2). Remove the connector of Y17 (Fuel injector 3). Check the circuit across Y16.2/1 and A4.X1.60/17 for open or short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Check the circuit across Y17.2/1 and A4.X1.60/16 for open or short circuit. Check the circuit across Y17.2/2 and A4.X1.60/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

2798-6: The fuel injector (cylinder 1) has a short circuit.

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • If the measured pattern for the evaluation of injector bank 1 is equal to applied behaviour bit pattern for short circuit error detection.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

		• None except FIDs.
System reaction		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 3) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 4) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 5) FId / Injector bank 1 shut off • 6) FId / Nominal Voltage Calibration NVC of injectors disabled • 7) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 8) FId / Redundant Engine shut off path not tested due to error of an injector • 9) FId / Redundant Engine shut off path test inhibited • 10) FId / Inhibit DPF monitor • 11) FId / Particulate filter (DPF) regeneration not possible due to general system failure • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) FId / Misfire Detection disabled • 15) FId / Inhibit OxiCat passive monitor • 16) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Short circuit in wiring or injector connected to bank 1.
Failure repair		• Check the wiring and injectors.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y16 (Fuel injector 2). Remove the connector of Y17 (Fuel injector 3). Check the circuit across Y16.2/1 and A4.X1.60/17 for open or short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Check the circuit across Y17.2/1 and A4.X1.60/16 for open or short circuit. Check the circuit across Y17.2/2 and A4.X1.60/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

2798-12: The DC/DC converter of Injector (Cylinder Bank 2) can not stop.

Generation condition		[Test Condition] • Each time that an attempt is made to switch off a DC/DC converter.
		[Fault Detection] • The bank DC/DC converter cannot be switched off.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 25% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None except FIDs
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Injector bank 1 shut off • 3) FId / Misfire Detection disabled • 4) FId / Inhibit OxiCat passive monitor • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• DC/DC converter cannot be shut off
Failure repair		• Check presence of other failures connected to injector supply (short circuit), check capacitor, replace ECM if power stage is responsible.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

2900-2: CAN-receive-frame Electronic transmission control: Data erratic, intermittent or incorrect

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Data length of the ETC7 is not equal to the specified data length in the CAN-DLC.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• Correct message data length
System reaction	• When there is an error in the reception of the frame, the value of Transmission engine crank enable is replaced by default value Com_stCrnkDsbl = 0.00-
Failure cause	• Wrong CAN configuration in Transmission Controller ECU

https://truckmanualshub.com/

Failure repair		• Check CAN configuration in Transmission Controller ECU
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A28 (DUONIC Control unit) side system.

2900-9: CAN timeout fault: CAN-receive-frame Electronic transmission control Abnormal update rate

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Fault is detected if a time out of ETC7 message occurs.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• When the frame is received, the time out error is cleared.
System reaction		• The value of 'Transmission engine crank enable' • Com_stCrnkDsbl is set to default value 0.00-
Failure cause		• Defective CAN controller of Gearbox Control Unit, under voltage of ETC, missing ETC, CAN cable connecting the ETC is disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the ETC to the network, check correct functioning of the ETC CAN controller and its voltage supply. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with A28 (DUONIC Control unit) is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of A28 (DUONIC Control unit). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

https://truckmanualshub.com/

3031-0: Signal Range Check (SRC) for 'DEF tank temperature' reports HIGH.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously if the ADC module does not report any error.
		[Fault Detection] • The Sensed raw voltage value SCR_uRawUTnkT is higher than 3.12V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• DEF Tank temperature is frozen at last valid value on preliminary failure and ramps to fixed replacement value 19.96°C {67.93°F} if failure is validated using slope 3300.00K/s or 3300.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) FId / Freeze DEF tank temperature value if preliminary failure is detected • 2) FId / Replace DEF tank temperature with default value if failure is validated • 3) FId / Inhibit physical range check of DEF temperature • 4) FId / Tank heating not released • 5) FId / Inhibit Monitoring of Tank Heater Circuit • 6) FId / Disable the sending of TESTING signal for heater Tank
Failure cause		• Sensor defective or short circuit in wiring to external source
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B36 (DEF temperature sensor). Check the circuit across A4.X2.94/89 and B36.4/4 for open or short circuit. Check the circuit across A4.X2.94/33 and B36.4/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "A40 (DEF tank)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19 (Intermediate connector). Check the circuit across A4.X2.94/33 and X19.16/6 for open or short circuit. Check the circuit across A4.X2.94/89 and X19.16/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B36 (DEF temperature sensor) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3031-1: Signal Range Check (SRC) for 'DEF tank temperature' reports LOW.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously if the ADC module does not report any error.
	[Fault Detection] • The Sensed raw voltage value SCR_uRawUTnkT is below 165.00mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• DEF Tank temperature is frozen at last valid value on preliminary failure and ramps to fixed replacement value 19.96°C {67.93°F} if failure is validated using slope 3300.00K/s or 3300.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
	• 1) FId / Freeze DEF tank temperature value if preliminary failure is detected • 2) FId / Replace DEF tank temperature with default value if failure is validated • 3) FId / Inhibit physical range check of DEF temperature • 4) FId / Tank heating not released • 5) FId / Inhibit Monitoring of Tank Heater Circuit • 6) FId / Disable the sending of TESTING signal for heater Tank
Failure cause	• Short circuit of sensor to battery or defective sensor
Failure repair	• Check wiring or replace sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B36 (DEF temperature sensor). Check the circuit across A4.X2.94/89 and B36.4/4 for open or short circuit. Check the circuit across A4.X2.94/33 and B36.4/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19. Check the circuit across A4.X2.94/33 and X19.16/6 for open or short circuit. Check the circuit across A4.X2.94/89 and X19.16/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B36 (DEF temperature sensor) and X19. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

3050-10: Pressure Oscillation too frequent Error.Abnormal Rate Of Change

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • After every system start a timer is started, if the duration between system start and Pressure Oscillation detection is smaller than 60.00min an error will be set.
		[Defect Debouncing] • Defect condition fulfilled continuously >10.0 ms
Fault healing		• This error will be healed if duration between system start and pressure oscillation detection > 60.00min
System reaction		• None
Failure cause		• Open item, should be checked with Bosch, probably too rigid pipes or excessive system vibrations
Failure repair		• See fault cause (probable cause non conformity of pipes)
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B30 (DEF pressure sensor). Check the circuit across A4.X2.94/79 and B30.3/3 for open or short circuit. Check the circuit across A4.X2.94/77 and B30.3/2 for open or short circuit. Check the circuit across A4.X2.94/43 and B30.3/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19. Check the circuit across A4.X2.94/43 and X19.16/12 for open or short circuit. Check the circuit across A4.X2.94/77 and X19.16/11 for open or short circuit. Check the circuit across A4.X2.94/79 and X19.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step8

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Repair or replace the harness across B30 (DEF pressure sensor) and X19. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2
	Step8	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3050-15: Pressurisation after starting SCR Reagent Feeding is not possible.

Generation condition	[Test Condition] • During system start up (refilling - pressure build up) • Refilling not inhibited by FID_ReFl due to another failure. • Pressure build up not inhibited by FID_PresBuildUp due to another failure. • System Ventilation not inhibited by FId_Vtln due to another failure.
	[Fault Detection] • If the DEF pressure does not reach 350kPa {51psi, 3.6kgf/cm^2} within 10.00s after 1.00- “pressure build up” cycles.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing	• Healing only possible at next system start, if the DEF pressure reaches 350kPa {51psi, 3.6kgf/cm^2} within 1.00- “pressure build up” cycles.
System reaction	• System goes into “stand-By” mode --> no pressurisation and no dosing possible. • Possibly power reduction to protect dosing valve against overheating, as no cooling by injection possible. • Further reactions according FID (see FID’s)
	• 1) Fid / Reagent dosing for SCR inhibited • 2) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 3) FId / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause	• DEF level too low (suction of air) • Suction tube leaky • Leakage in the DEF system outside or internal (i.e. back flow into tank, leakage into pump housing, external leakage). • Dosing valve blocked open. • Pump not delivering enough. • Reverting valve blocked open. • DEF pressure sensor shows too low values.

https://truckmanualshub.com/

Failure repair		• Check, if enough DEF was in tank when failure occurred (ambient conditions) • Check if pump can reach enough pressure with tester: set system under normal pressure (500kPa {73psi, 5.1kgf/cm^2}): • check if there is an external leakage (visible check) • if 500kPa {73psi, 5.1kgf/cm^2} reachable: open dosing valve fully for ~3 sec, if pressure drops < 420kPa {61psi, 4.3kgf/cm^2} --> pump not delivering enough or internal leakage --> check tubing for correct connection (suction tube!), replace pump module. If pressure remains stable --> system seems to be OK • if 500kPa {73psi, 5.1kgf/cm^2} not reachable: pump not delivering enough or internal leakage or dosing valve blocked open or reverting valve blocked open --> check tubing for correct connection (suction tube!), check dosing valve, replace pump module • Check dosing valve and reverting valve: Set pump speed to ~20% and actuate reverse valve --> pressure must drop down (< 80kPa {12psi, 0.8kgf/cm^2} absolute) - if OK: open dosing valve --> pressure must rise to ~100kPa {15psi, 1.0kgf/cm^2} absolute (=ambient) • If no depressurisation detected: reverting valve blocked closed or dosing valve open. • If there was a depressurisation before actuating the reverting valve --> reverting valve blocked closed.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If amount of DEF in DEF tank is not sufficient, add DEF. If DEF is leaking from A18 (DEF delivery pump), repair or replace If DEF is leaking from Y7 (DEF metering device), repair or replace If DEF is leaking from DEF tube, repair or replace For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A18 (DEF delivery pump) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Y7 (DEF metering device) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B30 (DEF pressure sensor) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Y20 (DEF switchover valve) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Remove Y7 (DEF metering device) from Exhaust pipe. Turn the starter switch in ON. Perform control and make sure that appropriate DEF can be added. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step9
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Turn the starter switch in OFF. Remove DEF tube from A18 (DEF delivery pump). Remove Y7 (DEF metering device) from DEF tube. Check the Clogging or Breaks at DEF tube. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Turn the starter switch in OFF. Replace component “Y7 (DEF metering device)”. Mount DEF tube on A18 (DEF delivery pump). Mount DEF tube on Y7 (DEF metering device). Mount Y7 (DEF metering device) on Exhaust pipe. Reinstall all the removed connectors. Turn the starter switch in ON. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step5
	Step11	Inspection procedure Turn the starter switch in OFF. Replace component “DEF tube”. Mount DEF tube on A18 (DEF delivery pump). Mount DEF tube on Y7 (DEF metering device). Mount Y7 (DEF metering device) on Exhaust pipe. Reinstall all the removed connectors. Turn the starter switch in ON. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step5

3050-16: Signal Range Check (SRC) for ‘DEF Pressure’ reports HIGH (Second level).Data Valid But Above Normal Operational Range.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • DEF pressure > 750kPa {110psi, 7.6kgf/cm^2}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

		• System goes into Stand-By state (= no dosing). • As soon as failure healed (i.e. DEF pressure < 750kPa {110psi, 7.6kgf/cm^2} for 65535.00- times) the system tries to start up --> possibly “toggling behaviour as stand-by - pressure build up - normal operation - stand-by....”.
System reaction		• 1) Fid / The DEF Dosing system goes into Error mode instead of Afterrun • 2) Fid / Reagent dosing for SCR inhibited • 3) DEF dosing inhibited --> Dosing system goes to error state • 4) Fid / DEF dosing system does not enter in pressure control mode (i.e. will not inject DEF) • 5) Pressure control of reagent dosing system inhibited --> dosing system goes into error state • 6) Pressure reduction procedure 1 of reagent dosing system activated (pressure reduction by open dosing valve and pump speed =) • 7) FId / Release of the SCRMon function/no emergency shut-off with emptying • 8) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 9) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 10) FId / Inhibit reverting valve plausibility check
Failure cause		• DEF level too low (suction of air) • Back flow into tank clogged • Pump control not OK (e.g. pump is running on max due to electric failure). • DEF pressure sensor shows too high values.
Failure repair		• Check if DEF level was OK when failure occurred (see ambient conditions). • Check if back flow line into tank is open (with test: adjust system to normal pressure (500kPa {73psi, 5.1kgf/cm^2}) and check, if pressure is constant, if not, stop pump --> pressure must drop down (=system emptying through back flow line)).
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3050-18: Pressure release during SCR Reagent Feeding is not possible.

Generation condition	[Test Condition] • System in the PRESSUREREDUCTION state (after a failure of DEF pressure during system start up or normal operation OR at system stop by Key 15) • Pressure reduction not inhibited by FID_PresRdc due to another failure.
	[Fault Detection] • The DEF pressure does not drop down to 50kPa {7.3psi, 0.5kgf/cm^2} within 5.50s.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing	• No healing in this driving cycle.
System reaction	• System goes into “Stand-By” state --> no evacuation of dosing system (risk of freezing¨) • Possibly also failure “SCRPODPlausURevVlv” stored.
	• 1) Fid / Reagent dosing for SCR inhibited • 2) Fid / The DEF dosing System goes in Error mode after Emptying • 3) Fid / DEF dosing system does not enter in pressure control mode (i.e. will not inject DEF) • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause	• Reverse valve does not work (blocked closed). • Back flow tube into tank clogged. • DEF pressure sensor stuck.
Failure repair	• Check if Back flow tube free. • Check if Reverse valve works with tester: set DEF pressure to 500kPa {73psi, 5.1kgf/cm^2} (dosing valve closed) - wait until pressure stable - actuate reverse valve --> if pressure does not drop down --> reverse valve does not work.

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3050-31: The measured Lambda value of NOx sensor devices from LSU sensor.

Generation condition		[Test Condition] • NOx sensor is ready • No DPF regeneration active • FId_DStgyMonLambda not set by another failure
		[Fault Detection] • DStgy_rLambdaRecDevFlt_mp outside applicable DStgy_rO2AdapFlt_mp dependent curves • window (between -0.05- at 0.00- and 0.05- at 0.00-)
		[Defect Debouncing] • Defect condition fulfilled continuously >60000.0 ms
Fault healing		• Lambda deviation in limits
System reaction		• None except FIDs
		• 1) FId / Require NOx sensor plausibility test • 2) FId / failure in a component for determination of NOx estimation • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Lambda sensor or NOx sensor measurement deviating
Failure repair		• If no LSU failures present NOx sensor probably defective. • If also NOx plausibility failure is present NOx sensor defective, replace NOx sensor. • If other LSU failure are presents, check LSU problems first.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with B29 (Oxygen sensor) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and B31.5/4 for open or short circuit. Check the circuit across A4.X2.94/61 and B31.5/3 for open or short circuit. Check the circuit across A20.X10.14/2 and B31.5/1 for open or short circuit. Check the circuit across B31.5/2 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6

Inspection procedure	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and X42.8/3 for open or short circuit. Check the circuit across A4.X2.94/61 and X42.8/2 for open or short circuit. Check the circuit across A20.X10.14/2 and X42.8/4 for open or short circuit. Check the circuit across X42.8/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across B29 (Oxygen sensor) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3051-0: Signal Range Check (SRC) for 'DEF Pressure' reports LOW.

Generation condition	[Test Condition] • Dosing system in normal operation ("metering control") and DEF pressure > 200kPa {29psi, 2.0kgf/cm^2} since 7.00s. • Monitoring not inhibited by FID_MetCtl due to another failure.
	[Fault Detection] • DEF pressure drops below 400kPa {58psi, 4.1kgf/cm^2} (but not below 200kPa {29psi, 2.0kgf/cm^2}) and does no more reach or exceed 420kPa {61psi, 4.3kgf/cm^2} during 10.00s.
	[Defect Debouncing] • Immediate
Fault healing	• DEF pressure > 420kPa {61psi, 4.3kgf/cm^2} after the system was depressurised and restarted again.
System reaction	• System goes into "pressure reduction" state and restarts with "pressure build up", i.e. no DEF injection. • Further reaction according FID (see FID's)
	• 1) Fid / Reagent dosing for SCR inhibited • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Inhibit reverting valve plausibility check
Failure cause	• DEF level too low (suction of air) • Leakage in the DEF system outside or internal (i.e. back flow into tank, leakage into pump housing, external leakage). • Pump not delivering enough. • Reverting valve blocked "open" (occurrence during normal operation - low probability) • DEF pressure sensor shows too low values.

https://truckmanualshub.com/

Failure repair		• Check, if enough DEF was in tank when failure occurred (ambient conditions) • Check if pump can reach enough pressure with tester: set system under normal pressure (500kPa {73psi, 5.1kgf/cm^2}): • check if there is an external leakage (visible check) • if 500kPa {73psi, 5.1kgf/cm^2} reachable: open dosing valve fully for ~3 sec, if pressure drops < 420kPa {61psi, 4.3kgf/cm^2} --> pump not delivering enough or internal leakage --> replace pump module. If pressure remains stable --> system seems to be OK • if 500kPa {73psi, 5.1kgf/cm^2} not reachable: pump not delivering enough or internal leakage or reverting valve blocked open--> replace pump module
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3051-16: Signal Range Check (SRC) for 'DEF Pressure' reports HIGH.

Generation condition		[Test Condition] • Dosing system in normal operation ("metering control") and monitoring not inhibited by FID_MetCtl due to another failure.
		[Fault Detection] • DEF pressure exceeds 650kPa {94psi, 6.6kgf/cm^2} and does no more drop below 600kPa {87psi, 6.1kgf/cm^2} during 60.00s.
		[Defect Debouncing] • Immediate
Fault healing		• DEF pressure remains < 650kPa {94psi, 6.6kgf/cm^2} after the system was depressurised and restarted again.
System reaction		• System goes into "pressure reduction" state and restarts with "pressure build up", i.e. no DEF injection. • If the DEF pressure exceeded 750kPa {110psi, 7.6kgf/cm^2}, then also the failure "SCRMonOvrPresErr" will be stored. • Further reaction according FID (see FID's)
		• 1) Fid / Reagent dosing for SCR inhibited • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Inhibit reverting valve plausibility check
Failure cause		• DEF level too low (suction of air) • Back flow into tank clogged • Pump control not OK (e.g. pump is running on max due to electric failure). • DEF pressure sensor shows too high values.
Failure repair		• Check if DEF level was OK when failure occurred (see ambient conditions). • Check if back flow line into tank is open (with test: adjust system to normal pressure (500kPa {73psi, 5.1kgf/cm^2}) and check, if pressure is constant, if not, stop pump --> pressure must drop down (=system emptying through back flow line)).
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3058-0: Positive governor deviation of EGR Control above upper limit.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • The check is carried out every 20ms if the EGR closed control loop is switched on, (AirCtl_swtGovEna = 1) and no other system error is present. • No DPF regeneration is active.
	[Fault Detection] • The limit for the maximum permissible positive control deviation of the exhaust-gas recirculation control has been exceeded. • Limit is applied in a map AirCtl_mMaxDvt_MAP depending on fuel quantity and engine speed.
	[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms

https://truckmanualshub.com/

Fault healing		• When the error is present in DFC_AirCtlGovDvtMax, to allow healing the closed control loop is restored in a speed/fuelling range between 600.00rpm and 600.00rpm / 0.00mg/hub and 10.00mg/hub • If the engine is running in this area and at the same time deviation is below the limit for the maximum permissible positive control deviation of the exhaust-gas recirculation failure is healed.
System reaction		• The exhaust-gas recirculation control is shut off and constant default values are output.
		• 1) FId / Check of gain plausibility of air flow meter (HFM/AFS) at low idle disabled • 2) FId / Enables healing of governor deviation in case of active governor deviation of Air (EGR) control • 3) FId / Inhibit ISS, max number of engine starts exceeded • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 6) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 7) FId / The Adaptation of lambda Sensor disabled • 8) FId / The Difference Check between several Lambda Sensors is disabled • 9) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 10) FId / Electrical Open Load Check of Lambda Sensor disabled • 11) FId / O2 Signal of Lambda Sensor not valid • 12) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 13) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 14) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 15) FId / Inhibit DPF monitor • 16) FId / Particulate filter ((DPF) Regeneration inhibited • 17) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 18) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 19) FId / Inhibit EGR cooler efficiency monitoring • 20) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 21) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 22) FId / Status of function identifier FId_EngDemTrqLimErr5 • 23) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Defective air mass flow sensor, leakage in the air duct, electrical or mechanical defect in EGR actuators or defect in wiring of EGR actuators
Failure repair		• Check air mass flow sensor, air duct, EGR actuators and their wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘A14 (EGR valve)’ is faulty. Component ‘Y8 (Exhaust gas recirculation actuator)’ is faulty. Damage of Intake system For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A14 (EGR valve) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Y8 (Exhaust gas recirculation actuator) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘A14 (EGR valve)’ is faulty. Component ‘Y8 (Exhaust gas recirculation actuator)’ is faulty. Damage of Intake system For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed
	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

3058-1: Negative governor deviation of EGR Control below lower limit.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • The check is carried out every 20ms if the EGR closed control loop is switched on, (AirCtl_swtGovEna = 1) and no other system error is present. • No DPF regeneration is active.
	[Fault Detection] • The limit for the maximum permissible negative control deviation of the exhaust-gas recirculation control has been exceeded. • Limit is applied in a map AirCtl_mMinDvt_MAP depending on fuel quantity and engine speed.
	[Defect Debouncing] • Defect condition fulfilled continuously >6000.0 ms
Fault healing	• When the error is present in DFC_AirCtlGovDvtMin, to allow healing the closed control loop is restored in a speed/fuelling range between 600.00rpm and 600.00rpm / 0.00mg/hub and 10.00mg/hub • If the engine is running in this area and at the same time deviation is below the limit for the maximum permissible positive control deviation of the exhaust-gas recirculation failure is healed.
System reaction	• The exhaust-gas recirculation control is shut off and constant default values are output.
	• 1) FId / Enables healing of governor deviation in case of active governor deviation of Air (EGR) control • 2) FId / Inhibit ISS, max number of engine starts exceeded • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 5) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 6) FId / The Adaptation of lambda Sensor disabled • 7) FId / The Difference Check between several Lambda Sensors is disabled • 8) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 9) FId / Electrical Open Load Check of Lambda Sensor disabled • 10) FId / O2 Signal of Lambda Sensor not valid • 11) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 12) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 13) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 14) FId / Inhibit DPF monitor • 15) FId / Particulate filter ((DPF) Regeneration inhibited • 16) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 17) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 18) FId / Inhibit EGR cooler efficiency monitoring • 19) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 20) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 21) FId / Status of function identifier FId_EngDemTrqLimErr5 • 22) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause	• Defective air mass flow sensor, obstruction or leackage in air duct, electrical or mechanical defect in EGR actuators or defect in wiring of EGR actuators

https://truckmanualshub.com/

Failure repair		• Check air mass flow sensor, air duct, EGR actuators and their wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'A14 (EGR valve)' is faulty. If one of diagnosis codes associated with Y8 (Exhaust gas recirculation actuator) is generated, make a system diagnosis according to the diagnosis code. Damage of Intake system Plugged Intake system For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A14 (EGR valve) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component "B18 (Air flow and intake air temperature sensor)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'A14 (EGR valve)' is faulty. If one of diagnosis codes associated with Y8 (Exhaust gas recirculation actuator) is generated, make a system diagnosis according to the diagnosis code. Damage of Intake system Plugged Intake system For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

3058-16: Positive governor deviation of EGR Control above upper limit for regeneration.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • The check is carried out every 20ms if the EGR closed control loop is switched on, (AirCtl_swtGovEna = 1) and no other system error is present. • DPF regeneration is active.
	[Fault Detection] • The limit for the maximum permissible positive control deviation of the exhaust-gas recirculation control has been exceeded. • Limit is applied in a map AirCtl_mMaxDvtRgn_MAP depending on fuel quantity and engine speed.
	[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing	• When the error is present in DFC_AirCtlGovDvtEOMMax, to allow healing the closed control loop is restored in a speed/fuelling range between 600.00rpm and 600.00rpm / 0.00mg/hub and 10.00mg/hub • If the engine is running in this area and at the same time deviation is below the limit for the maximum permissible positive control deviation of the exhaust-gas recirculation failure is healed.

https://truckmanualshub.com/

System reaction		• The exhaust-gas recirculation control is shut off and constant default values are output.
		• 1) FId / EGR switched off • 2) FId / Particulate filter ((DPF) Regeneration inhibited • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / Inhibit EGR cooler efficiency monitoring • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 7) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 8) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 9) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 10) FId / Status of function identifier FId_EngDemTrqLimErr5 • 11) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Defective air mass flow sensor, leakage in the air duct, electrical or mechanical defect in EGR actuators or defect in wiring of EGR actuators
Failure repair		• Check air mass flow sensor, air duct, EGR actuators and their wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘A14 (EGR valve)’ is faulty. Component ‘Y8 (Exhaust gas recirculation actuator)’ is faulty. Damage of Intake system For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A14 (EGR valve) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Y8 (Exhaust gas recirculation actuator) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'A14 (EGR valve)' is faulty. Component 'Y8 (Exhaust gas recirculation actuator)' is faulty. Damage of Intake system For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed
	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

3058-18: Negative governor deviation of EGR Control below lower limit for regeneration.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • The check is carried out every 20ms if the EGR closed control loop is switched on, (AirCtl_swtGovEna = 1) and no other system error is present. • DPF regeneration is active.
	[Fault Detection] • The limit for the maximum permissible negative control deviation of the exhaust-gas recirculation control has been exceeded. • Limit is applied in a map AirCtl_mMinDvtRgn_MAP depending on fuel quantity and engine speed.
	[Defect Debouncing] • Defect condition fulfilled continuously >10000.0 ms

https://truckmanualshub.com/

Fault healing		• When the error is present in DFC_AirCtlGovDvtEOMMin, to allow healing the closed control loop is restored in a speed/fuelling range between 600.00rpm and 600.00rpm / 0.00mg/hub and 10.00mg/hub • If the engine is running in this area and at the same time deviation is below the limit for the maximum permissible positive control deviation of the exhaust-gas recirculation failure is healed.
System reaction		• The exhaust-gas recirculation control is shut off and constant default values are output.
		• 1) FId / EGR switched off • 2) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 3) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 4) FId / Particulate filter ((DPF) Regeneration inhibited • 5) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 6) FId / Inhibit EGR cooler efficiency monitoring • 7) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 8) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 9) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 10) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 11) FId / Status of function identifier FId_EngDemTrqLimErr5 • 12) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Defective air mass flow sensor, obstruction or leakage in air duct, electrical or mechanical defect in EGR actuators or defect in wiring of EGR actuators
Failure repair		• Check air mass flow sensor, air duct, EGR actuators and their wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘A14 (EGR valve)’ is faulty. Component ‘Y8 (Exhaust gas recirculation actuator)’ is faulty. Damage of Intake system Plugged Intake system For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A14 (EGR valve) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Y8 (Exhaust gas recirculation actuator) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘A14 (EGR valve)’ is faulty. Component ‘Y8 (Exhaust gas recirculation actuator)’ is faulty. Damage of Intake system Plugged Intake system For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed
	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

https://truckmanualshub.com/

3058-31: EGR Valve spent too long time in transition mode ‘Regeneration’ to ‘Normal Operation’.

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun • During transition from regeneration too normal mode.
		[Fault Detection] • The Output of the Air Controller does not reach 50.00% within 30.00s
		[Defect Debouncing] • Immediate
Fault healing		• No healing possible in the same driving cycle
System reaction		• None
Failure cause		• Defect in the EGR actuators (EGR- and throttle valve) • Calibration error (wrong layout of the open loop EGR control during transition from Regeneration to normal mode)
Failure repair		• Check for errors of the EGR actuators (correct installation, wiring, electrical connectors, jammed actuator) • Contact Help desk.
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed

Inspection procedure	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3217-0: Signal Range Check (SRC) for 'O2 calibration' reports HIGH.

Generation condition	[Test Condition] • Continuously when following conditions fulfilled: • The calibration is active. • No Error of LSU • FId_LSUO2Clb0 is not active due to another failure Engine in operating range 1 (speed between 300.00rpm and 1200.00rpm and load between 2.00mg/hub and 20.00mg/hub)
	[Fault Detection] • The analogic signal for the O2 ratio exceeds during the calibration 200.00mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing	• The analogic signal for the O2 ratio is below 200.00mV during the calibration
System reaction	• Last valid value of O2 Calibration is taken and no further calibration is made. • Further reactions according FID (see FID)
	• 1) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 2) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 3) FId / The Adaptation of lambda Sensor disabled • 4) FId / The Difference Check between several Lambda Sensors is disabled • 5) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 6) FId / Heater Coupling Check of lambda Sensor disabled • 7) FId / Electrical Open Load Check of Lambda Sensor disabled • 8) FId / Shunting Detection of Lambda Sensor disabled • 9) FId / The adaptation values for Lambda Sensor stored in EEPROM are reset to • 10) FId / O2 Measurement of Lambda sensor not valid • 11) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken
Failure cause	• Defect in wiring of lambda sensor, inaccurate or defective lambda sensor, problems with EGR actuators or injection system
Failure repair	• Check wiring and accuracy of lambda sensor, check functioning of injection system and EGR actuators, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester) • Note for EURO OBD application: this failure activates a Performance limitation due to legislation. Therefore after repair following procedure must be done, otherwise there is the risk that performance limiter gets active, although the failure is repaired: • 1) clear memory with tester • 2) if performance limiter active: disable it with tester • 3) drive the vehicle ~20min in engine speed range >1600rpm with constant periods of ~5 sec and more than 5 motoring phases > 10sec (highest gear) • 4) check with "OBD scan tool" Service $01 (or Readiness state) that "comprehensive components" are "ready" • 5) if not: repeat the procedure

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with A14 (EGR valve) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across B29.6/6 and A4.X2.94/78 for open or short circuit. Check the circuit across B29.6/1 and A4.X2.94/76 for open or short circuit. Check the circuit across B29.6/3 and A4.X2.94/51 for open or short circuit. Check the circuit across B29.6/2 and A4.X2.94/86 for open or short circuit. Check the circuit across B29.6/4 and A20.X10.14/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3217-1: Signal Range Check (SRC) for 'O2 calibration' reports LOW.

Generation condition		[Test Condition] • Continuously when following conditions fulfilled: • The calibration is active. • No Error of LSU • FId_LSUO2Clb0 is not active due to another failure Engine in operating range 1 (speed between 300.00rpm and 1200.00rpm and load between 2.00mg/hub and 20.00mg/hub)
		[Fault Detection] • The analogic signal for the O2 is below -200.00mV during the calibration
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing		• No defect is detected The analogic signal for the O2 exceeds -200.00mV during the calibration
System reaction		• Last valid value of O2 Calibration is taken and no further calibration is made. • Further reactions according FID (see FID)
		• 1) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 2) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 3) FId / The Adaptation of lambda Sensor disabled • 4) FId / The Difference Check between several Lambda Sensors is disabled • 5) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 6) FId / Heater Coupling Check of lambda Sensor disabled • 7) FId / Electrical Open Load Check of Lambda Sensor disabled • 8) FId / Shunting Detection of Lambda Sensor disabled • 9) FId / The adaptation values for Lambda Sensor stored in EEPROM are reset to • 10) FId / O2 Measurement of Lambda sensor not valid • 11) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken
Failure cause		• Defect in wiring of lambda sensor, inaccurate or defective lambda sensor, problems with EGR actuators or injection system
Failure repair		• Check wiring and accuracy of lambda sensor, check functioning of injection system and EGR actuators, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester) • Note for EURO OBD application: this failure activates a Performance limitation due to legislation. Therefore after repair following procedure must be done, otherwise there is the risk that performance limiter gets active, although the failure is repaired: • 1) clear memory with tester • 2) if performance limiter active: disable it with tester • 3) drive the vehicle ~20min in engine speed range >1600rpm with constant periods of ~5 sec and more than 5 motoring phases > 10sec (highest gear) • 4) check with "OBD scan tool" Service $01 (or Readiness state) that "comprehensive components" are "ready" • 5) if not: repeat the procedure
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with A14 (EGR valve) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across B29.6/6 and A4.X2.94/78 for open or short circuit. Check the circuit across B29.6/1 and A4.X2.94/76 for open or short circuit. Check the circuit across B29.6/3 and A4.X2.94/51 for open or short circuit. Check the circuit across B29.6/2 and A4.X2.94/86 for open or short circuit. Check the circuit across B29.6/4 and A20.X10.14/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3217-16: O2 value above maximum threshold

Generation condition	[Test Condition] • Continuously if all following conditions fulfilled: • LSU not in calibration mode • LSU not in a failure mode • Exhaust gas pressure < 160kPa {23psi, 1.6kgf/cm^2} • Monitoring not inhibit by FID_LSUO2SRC0 due to another failure
	[Fault Detection] • The analogic signal for the O2 ratio is higher than or equal 3.20V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• Healing is only possible in overrun (engine in motoring phase) and the signal is below 3.20V

https://truckmanualshub.com/

		• Last valid O2 signal frozen • Further reactions according FID (See FID)
System reaction		• 1) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 2) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 3) FId / The Adaptation of lambda Sensor disabled • 4) FId / The Difference Check between several Lambda Sensors is disabled • 5) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 6) FId / Heater Coupling Check of lambda Sensor disabled • 7) FId / Electrical Open Load Check of Lambda Sensor disabled • 8) FId / Shunting Detection of Lambda Sensor disabled • 9) FId / The adaptation values for Lambda Sensor stored in EEPROM are reset to • 10) FId / O2 Measurement of Lambda sensor not valid • 11) FId / O2 Calibration disabled (last valid calibration value fixed) • 12) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 13) FId / Open Load Check for the Virtual Ground (VG) and Nernst Cell (UN) of Lambda Sensor disabled
Failure cause		• Defect in wiring (open circuit at line IA (Pump Cell)), Excessive drifting in O2 concentration during overrun, Defective lambda sensor, • Short circuit to external source
Failure repair		• Reset the Calibration factor and measure the O2 signal in overrun phase. Let the system learn (see failure LSU_O2ClbMin or Max: testing conditions are equal to learning condition) and read the voltage at motoring (O2 content = 20.95%). If the signal still > 3.20V --> replace sensor (and reset all learning values in EEPROM with tester) • Check entire wiring • Note for EURO OBD application: this failure activates a Performance limitation due to legislation. Therefore after repair following procedure must be done, otherwise there is the risk that performance limiter gets active, although the failure is repaired: • 1) clear memory with tester • 2) if performance limiter active: disable it with tester • 3) drive the vehicle ~20min in engine speed range >1600rpm with constant periods of ~5 sec and more than 5 motoring phases > 10sec (highest gear) • 4) check with “OBD scan tool” Service $01 (or Readiness state) that “comprehensive components” are “ready” • 5) if not: repeat the procedure
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across B29.6/6 and A4.X2.94/78 for open or short circuit. Check the circuit across B29.6/1 and A4.X2.94/76 for open or short circuit. Check the circuit across B29.6/3 and A4.X2.94/51 for open or short circuit. Check the circuit across B29.6/2 and A4.X2.94/86 for open or short circuit. Check the circuit across B29.6/4 and A20.X10.14/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step9
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. No occurrence? No: Go to Step8 Yes: Go to Step5

3221-0: O2 Concentration at overrunHIGH

Generation condition		[Test Condition] • Lambda sensor working in normal condition (no learning or calibration mode active) and O2 signal valid • Monitoring not inhibited by FID_LSUPlausChk0 due to another failure • Fuel level > 0.00l • Battery Voltage > 10.70V • By Data set via Bit Mask LSU_stOpMMonEnaMsk: engine in normal operation • Engine in steady state, i.e. the variation of calculated O2 concentration (by air flow and fuel injection) < 0.01- during 1.50s • Engine in overrun condition (engine speed between 1000.00rpm and 4000.00rpm and engine load between -10.00mg/hub and 0.20mg/hub and Air flow between 50.00mg/Hub and 1500.00mg/Hub) • Air mass passed through engine while all conditions above are fulfilled >= 150.00g • By Data set via Bit Mask LSU_stMskEGROvrn: EGR off due engine in normal operation and overrun
		[Fault Detection] • The measured and Temperature compensated, pressure compensated and (incl Temperature)) O2-concentration is higher than the calculated (and filtered by 0.30s) by more than 0.04- (0.21 corresponds to air with 21% O2
		[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00 events • Failure is detected if active for 50% of events
Fault healing		• The measured and Temperature compensated, pressure compensated and (incl Temperature)) O2-concentration is NOT higher than the calculated (and filtered by 0.30s) by more than 0.04- (0.21 corresponds to air with 21% O2
System reaction		• Only according FID (See FID)
		• 1) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 2) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 3) FId / The Adaptation of lambda Sensor disabled • 4) FId / The Difference Check between several Lambda Sensors is disabled • 5) FId / O2 Signal of Lambda Sensor not valid
Failure cause		• Leakage or blockage in exhaust gas system, defect in wiring of lambda sensor, inaccurate lambda or air flow sensor, problems in injection system (e.g. blockage in injectors)
Failure repair		• Check exhaust gas system, check wiring of lambda sensor, check accuracy of lambda and air flow sensor, reset all learning factors of LSU in EEPROM and recheck the accuracy of LSU, check injection system, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester) • Note for EURO OBD application: this failure activates a Performance limitation due to legislation. Therefore after repair following procedure must be done, otherwise there is the risk that performance limiter gets active, although the failure is repaired: • 1) clear memory with tester • 2) if performance limiter active: disable it with tester • 3) drive the vehicle ~20min in engine speed range >1600rpm with constant periods of ~5 sec and more than 5 motoring phases > 10sec (highest gear) • 4) check with “OBD scan tool” Service $01 (or Readiness state) that “comprehensive components” are “ready” • 5) if not: repeat the procedure
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Exhaust system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B18 (Air flow and intake air temperature sensor) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across B29.6/6 and A4.X2.94/78 for open or short circuit. Check the circuit across B29.6/1 and A4.X2.94/76 for open or short circuit. Check the circuit across B29.6/3 and A4.X2.94/51 for open or short circuit. Check the circuit across B29.6/2 and A4.X2.94/86 for open or short circuit. Check the circuit across B29.6/4 and A20.X10.14/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step11
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step10
	Step10	Inspection completed

Inspection procedure	Step11	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. No occurrence? No: Go to Step10 Yes: Go to Step7

3221-1: O2 Concentration at overrunLOW

Generation condition	[Test Condition] • Lambda sensor working in normal condition (no learning or calibration mode active) and O2 signal valid • Monitoring not inhibited by FID_LSUPlausChk0 due to another failure • Fuel level > 0.00l • Battery Voltage > 10.70V • By Data set via Bit Mask LSU_stOpMMonEnaMsk: engine in normal operation • Engine in steady state, i.e. the variation of calculated O2 concentration (by air flow and fuel injection) < 0.01- during 1.50s • Engine in overrun condition (engine speed between 1000.00rpm and 4000.00rpm and engine load between -10.00mg/hub and 0.20mg/hub and Air flow between 50.00mg/Hub and 1500.00mg/Hub) • Air mass passed through engine while all conditions above are fulfilled >= 150.00g • By Data set via Bit Mask LSU_stMskEGROvrn: EGR off due engine in normal operation and overrun
	[Fault Detection] • The measured and Temperature compensated, pressure compensated and (incl Temperature)) O2-concentration is lower than the calculated (and filtered by 0.30s) by more than 0.05- (0.21 corresponds to air with 21% O2.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00 events • Failure is detected if active for 50% of events
Fault healing	• The measured and Temperature compensated, pressure compensated and (incl Temperature)) O2-concentration is NOT lower than the calculated (and filtered by 0.30s) by more than 0.05- (0.21 corresponds to air with 21% O2.
System reaction	• Only according FID (See FID)
	• 1) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 2) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 3) FId / The Adaptation of lambda Sensor disabled • 4) FId / The Difference Check between several Lambda Sensors is disabled • 5) FId / O2 Signal of Lambda Sensor not valid
Failure cause	• Leakage or blockage in exhaust gas system, defect in wiring of lambda sensor, inaccurate lambda or air flow sensor, problems in injection system (e.g. leaky injectors)
Failure repair	• Check exhaust gas system, check wiring of lambda sensor, check accuracy of lambda and air flow sensor, reset all learning factors of LSU in EEPROM and recheck the accuracy of LSU, check injection system, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester) • Note for EURO OBD application: this failure activates a Performance limitation due to legislation. Therefore after repair following procedure must be done, otherwise there is the risk that performance limiter gets active, although the failure is repaired: • 1) clear memory with tester • 2) if performance limiter active: disable it with tester • 3) drive the vehicle ~20min in engine speed range >1600rpm with constant periods of ~5 sec and more than 5 motoring phases > 10sec (highest gear) • 4) check with “OBD scan tool” Service $01 (or Readiness state) that “comprehensive components” are “ready” • 5) if not: repeat the procedure

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Exhaust system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B18 (Air flow and intake air temperature sensor) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across B29.6/6 and A4.X2.94/78 for open or short circuit. Check the circuit across B29.6/1 and A4.X2.94/76 for open or short circuit. Check the circuit across B29.6/3 and A4.X2.94/51 for open or short circuit. Check the circuit across B29.6/2 and A4.X2.94/86 for open or short circuit. Check the circuit across B29.6/4 and A20.X10.14/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step11
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step10
	Step10	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step11	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. No occurrence? No: Go to Step10 Yes: Go to Step7

3232-5: Component 'NOx sensor' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this t
		[Fault Detection] • If NOx sensor has detected Heater open wire fault Com_stBytNOxSens[0]==1
		[Defect Debouncing] • Defect condition fulfilled continuously > 2000.0 ms
Fault healing		• If NOx sensor does not send the Message "Open wire"
System reaction		• The NOx sensor does not get ready for measurement --> SCR Dosing can not work in closed loop control and no NOx monitoring possible • According FID (see FID's)
		• 1) Fid/ NOx Sensor not working correctly --> System monitoring with NOx sensor inhibited • 2) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Wiring defect • NOx Sensor defect
Failure repair		• Check wiring (specially heating wires) • Check NOx Sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and B31.5/4 for open or short circuit. Check the circuit across A4.X2.94/61 and B31.5/3 for open or short circuit. Check the circuit across A20.X10.14/2 and B31.5/1 for open or short circuit. Check the circuit across B31.5/2 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B29 (Oxygen sensor)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and X42.8/3 for open or short circuit. Check the circuit across A4.X2.94/61 and X42.8/2 for open or short circuit. Check the circuit across A20.X10.14/2 and X42.8/4 for open or short circuit. Check the circuit across X42.8/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B29 (Oxygen sensor) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3232-6: Component ‘NOx sensor’ has a short circuit.Current above normal or grounded circuit

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn’t running yet, while the engine isn’t cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this t
	[Fault Detection] • If NOx sensor has detected Heater short circuit fault Com_stBytNOxSens[4]==1
	[Defect Debouncing] • Defect condition fulfilled continuously > 2000.0 ms
Fault healing	• If the Sensor does not send the message “short circuit” detected
System reaction	• The NOx sensor does not get ready for measurement --> SCR Dosing can not work in closed loop control and no NOx monitoring possible • According FID (see FID’s)
	• 1) Fid/ NOx Sensor not working correctly --> System monitoring with NOx sensor inhibited • 2) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)

https://truckmanualshub.com/

Failure cause		• Wiring harness has short circuit • NOx Sensor defect
Failure repair		• Check wiring harness • Check Sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and B31.5/4 for open or short circuit. Check the circuit across A4.X2.94/61 and B31.5/3 for open or short circuit. Check the circuit across A20.X10.14/2 and B31.5/1 for open or short circuit. Check the circuit across B31.5/2 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and X42.8/3 for open or short circuit. Check the circuit across A4.X2.94/61 and X42.8/2 for open or short circuit. Check the circuit across A20.X10.14/2 and X42.8/4 for open or short circuit. Check the circuit across X42.8/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B29 (Oxygen sensor) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3234-2: Component 'NOx sensor' has an open circuit or short circuit.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun continuously
		[Fault Detection] • The NOx Sensor sends the message "Lambda signal not plausible" (Bits 2-3 = 00) OR "NOx signal not plausible (bits 4-5=00)
		[Defect Debouncing] • Defect condition fulfilled continuously > 240000.0 ms
Fault healing		• The NOx Sensor sends the message "Lambda signal plausible" (Bits 2-3 = 01) AND "NOx signal plausible (bits 4-5=01)
System reaction		• According FID (see FID's) • Usually the NOx signal is set to FFFF by the Sensor itself which causes a fix NOx concentration of 1.20-.
		• 1) Fid/ NOx Sensor not working correctly --> System monitoring with NOx sensor inhibited • 2) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Short Circuit or Open wire in wiring harness • Defective NOx Sensor
Failure repair		• Check wiring harness • Check NOx Sensor • Note for EURO OBD application: this failure activates a Performance limitation due to legislation. Therefore after repair following procedure must be done, otherwise there is the risk tha performance limiter gets active, although the failure is repaired: • 1) clear memory with tester • 2) if performance limiter active: disable it with tester • 3) drive the vehicle ~20min in engine speed range >1600rpm with constant periods of ~5 sec and more than 5 motoring phases > 10sec (highest gear) • 4) check with "OBD scan tool" Service $01 (or Readinsess state) that "comprehensive components" are "ready" • 5) if not: repeat the procedure
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and B31.5/4 for open or short circuit. Check the circuit across A4.X2.94/61 and B31.5/3 for open or short circuit. Check the circuit across A20.X10.14/2 and B31.5/1 for open or short circuit. Check the circuit across B31.5/2 and Ground for open or short circuit. Make a visual check on each connector. 3241-0: Defect Fault Check for Exhaust temperature upstream of oxidation catalytic converter.Signal value above maximum limit

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • The sensed raw voltage value Exh_uRawTOxiCatUs is above 4.00V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensed raw voltage value Exh_uRawTOxiCatUs is below 4.00V
System reaction	• Oxidation Catalyser temperature is frozen at last valid value on preliminary failure and ramps, using slope 300.00K/s or 300.00K/s depending whether the measured value is above or below replacement value, to a fixed replacement value of 79.96°C {175.93°F} • Further reactions according FID (see FID's)
	• 1) FId / Particulate filter ((DPF) Regeneration inhibited • 2) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 3) FId / Temperature OxiCat upstream defective • 4) FId / Freeze OxiCat Upstream temperature if preliminary failure is detected • 5) FId / Function Identifier to inhibit plausibility check for the sensed temperature upstream of Oxi-catalyst • 6) FId / Replace OxiCat Upstream temperature with default value if failure is validated • 7) FId / Inhibit OxiCat passive monitor • 8) FId / Plausibilty check of temperature sensors at cold start not allowed • 9) FId / Physical signal range check of temperature sensor 1 inhibited • 10) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 11) FId / Inhibit Physical Range Check of sensed temperature upstream of OxiCat
Failure cause	• Short circuit of sensor to external source or defective sensor
Failure repair	• Check wiring and sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X2.94/11 and B23.2/1 for open circuit. Check electrical line between pins A4.X2.94/60 and B23.2/2 for open circuit. Check electrical line between pins A4.X2.94/11 and B23.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B23 (Temperature sensor Exhaust system 1) for short-circuit to another line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B23 (Temperature sensor Exhaust system 1)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step1

3241-1: Defect Fault Check for Exhaust temperature upstream of oxidation catalytic converter.Signal value below minimum limit

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • The sensed raw voltage value Exh_uRawTOxiCatUs is below 500.00mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• The sensed raw voltage value Exh_uRawTOxiCatUs is above 500.00mV

https://truckmanualshub.com/

		• Oxidation Catalyser temperature is frozen at last valid value on preliminary failure and ramps, using slope 300.00K/s or 300.00K/s depending whether the measured value is above or below replacement value, to a fixed replacement value of 79.96°C {175.93°F} • Further reactions according FID (see FID's)

Failure cause		• Inaccurate or defective temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the temperature sensor and replace it if necessary
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X2.94/11 and B23.2/1 for open circuit. Check electrical line between pins A4.X2.94/60 and B23.2/2 for open circuit. Check electrical line between pins A4.X2.94/11 and B23.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B23 (Temperature sensor Exhaust system 1) for short-circuit to another line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "B23 (Temperature sensor Exhaust system 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3241-31: Plausibility check of component 'Exhaust temperature upstream of diesel oxidation catalytic converter 1' The received data are implausible.

Generation condition	[Test Condition] • once in a driving cycle if following conditions are true: • monitoring not disabled by FID_ExhTMonPlausTemp due to another failure. • Not in high altitude (ambient pressure > 50kPa {7.3psi, 0.5kgf/cm^2} • The time since last engine stop > 5.00h (time usually taken via CAN from tachograph). • In case the timer or the CAN transmission is defective, the monitoring is inhibited (by FID_ExhTMonPlausTemp)
	[Fault Detection] • Exhaust Temperature Sensor before Oxicat deviates from Exhaust Temperature Sensor after Oxicat (if available) and Exhaust Temperature Sensor before DPF (if available) and Exhaust Temperature Sensor after DPF (if available) and Exhaust Temperature Sensor after DPF (if available) and Exhaust Temperature Sensor after DPF (if available)
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• Healing only possible at next driving cycle and the test condition released: Healing if all temperatures are similar
System reaction	• Only according FID (see FID)
	• 1) FId / Inhibit OxiCat passive monitor • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Particulate filter ((DPF) Regeneration inhibited • 4) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 5) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 6) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 7) FId / Inhibit DPF efficiency monitor • 8) FId / Interrupt DPF efficiency monitor
Failure cause	• Exhaust Temperature Sensor before Oxicat measures wrong values

https://truckmanualshub.com/

Failure repair		• Note: Too fast ambient temperature change, e.g. vehicle (and dedicated temperature sensor) exposed to sun shine after very cold night, or if the sensor is in a “warm air stream” (e.g. by additional engines like a cooling compressor for a cold compartment which runs also during vehicle stand still, or an external source like a “exhaust stream” of a building climatisation) can cause this failure, if the ambient of this sensor is not equal to the “normal” ambient! --> in this case no action needed! • Check wiring and connectors for correct contact (corrosion). • Check sensor and replace it if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If this diagnosis code has occurred during operation in an environment which was often exposed to sudden temperature change, investigate the driving conditions at that time because it may have been temporary. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X2.94/11 and B23.2/1 for open circuit. Check electrical line between pins A4.X2.94/60 and B23.2/2 for open circuit. Check electrical line between pins A4.X2.94/11 and B23.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B23 (Temperature sensor Exhaust system 1) for short-circuit to another line. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B23 (Temperature sensor Exhaust system 1)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step1

3244-2: Plausibility check of component ‘Particle Filter Upstream Temperature Sensor’Data erratic, intermittent or incorrect

Generation condition	[Test Condition] • FId_TPFltUsNpl is not inhibited by another failure • 6.67min time has elapsed since the change of engine to normal running state • 6.67min time has elapsed since the plausibility check inhibition due to DPF regeneration state. • The examination takes place continuously.
	[Fault Detection] • An error is detected if the difference between the temperature upstream of Exh_tPFltUs, and the modelled • Exhaust Temperature after Oxicat higher than +/- the (calculated) temperature dependant limit (curves) (Exh_tDiffPosTOxiCatUs/ Exh_tDiffNegTOxiCatUs).
	[Defect Debouncing] • Defect condition exceeded cumulatively > 15.00s • Failure is detected if active for 50% of the time
Fault healing	• Temperature difference from model is in range

https://truckmanualshub.com/

System reaction		• None (only via Inhibit Handler)
		• 1) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 2) FId / Particulate filter ((DPF) Regeneration inhibited • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / Inhibit DPF upstream Temperature sensor adaption • 5) FId / Inhibit OxiCat passive monitor • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 7) FId / Engine protection DPF regeneration inhibited due to faulty input signals • 8) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 9) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 10) FId / The Adaptation of lambda Sensor disabled
Failure cause		• An abnormal heating of the exhaust system has occurred or DPF upstream temperature sensor is inaccurate.
Failure repair		• Let engine cool down before restarting and check sensor accuracy. • If the real exhaust temperature really differs from the calculated one due to a failure in the engine like: • wrong injection pressure, • wrong injection begin • wrong EGR rate • the engine system should be checked.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3244-16: Signal Range Check (SRC) for 'Exhaust gas temperature upstream of diesel particulate filter (raw value)' reports HIGH.

Generation condition	[Test Condition] • Continuously if ADC is not reporting an electrical problem on the sensor
	[Fault Detection] • The sensed sensor signal Exh_tSensTPFltUs is above 999.96°C {1831.93°F}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensed sensor signal Exh_tSensTPFltUs is below 999.96°C {1831.93°F}

https://truckmanualshub.com/

System reaction		• DPF temperature upstream is frozen at last valid value on preliminary failure and ramps, using slope 300.00K/s or 300.00K/s depending whether the measured value is above or below replacement value, to a fixed replacement value of 99.96°C {211.93°F} • Further reactions according FID (see FID's)
		• 1) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 2) FId / Particulate filter ((DPF) Regeneration inhibited • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / Freeze DPF Temperature upstream if preliminary failure is detected • 5) FId / Inhibit the plausibility check for DPF upstream temperature with model • 6) FId / Replace DPF Temperature upstream with default value if failure is validated • 7) FId / Inhibit DPF upstream Temperature sensor adaption • 8) FId / Inhibit OxiCat passive monitor • 9) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 10) FId / Engine protection DPF regeneration inhibited due to faulty input signals • 11) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 12) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 13) FId / The Adaptation of lambda Sensor disabled
Failure cause		• Inaccurate or defective temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the temperature sensor and replace it if necessary
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X2.94/12 and B24.2/1 for open circuit. Check electrical line between pins A4.X2.94/63 and B24.2/2 for open circuit. Failure repair		• Note: Too fast ambient temperature change, e.g. vehicle (and dedicated temperature sensor) exposed to sun shine after very cold night, or if the sensor is in a “warm air stream” (e.g. by additional engines like a cooling compressor for a cold compartment which runs also during vehicle stand still, or an external source like a “exhaust stream” of a building climatisation) can cause this failure, if the ambient of this sensor is not equal to the “normal” ambient! --> in this case no action needed! • Check wiring and connectors for correct contact (corrosion). • Check sensor and replace it if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If this diagnosis code has occurred during operation in an environment which was often exposed to sudden temperature change, investigate the driving conditions at that time because it may have been temporary. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X2.94/12 and B24.2/1 for open circuit. Check electrical line between pins A4.X2.94/63 and B24.2/2 for open circuit. Check electrical line between pins A4.X2.94/12 and B24.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B24 (Temperature sensor Exhaust system 2) for short-circuit to another line. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B24 (Temperature sensor Exhaust system 2)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

3248-0: Signal Range Check (SRC) for 'temperature after SCR catalyst' reports HIGH.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously if the ADC module does not report any error.
		[Fault Detection] • The Sensed raw voltage value SCR_uRawUCatDsT is above 4.00V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 700.00ms • Failure is detected if active for 50% of the time
Fault healing		• The Sensed raw voltage value SCR_uRawUCatDsT is below 4.00V
System reaction		• DEF catalyst downstream temperature is frozen at last valid value on preliminary failure and ramps to fixed replacement value 26.96°C {80.53°F} if failure is validated using slope 3300.00K/s or 3300.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
		• 1) FId / Replace Cat Downstream temperature with default value if failure is validated • 2) FId / Plausibilty check of temperature sensors at cold start not allowed • 3) Fid / Reagent dosing for SCR inhibited • 4) FId / Physical signal range check of temperature sensor 4 inhibited • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / Inhibit Physical Range Check of sensed Catalyst Downstream temperature
Failure cause		• Sensor defective or short circuit in wiring to external source
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B32 (Temperature sensor "SCR catalytic converter" 2). Check the circuit across A4.X2.94/55 and B32.2/1 for open or short circuit. Check the circuit across A4.X2.94/9 and B32.2/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component "B32 (Temperature sensor "SCR catalytic converter" 2)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Check the circuit across A4.X2.94/55 and X42.8/6 for open or short circuit. Check the circuit across A4.X2.94/9 and X42.8/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across B32 (Temperature sensor “SCR catalytic converter” 2) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3248-1: Signal Range Check (SRC) for ‘temperature after SCR catalyst’ reports LOW.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously if the ADC module does not report any error.
	[Fault Detection] • The Sensed raw voltage value SCR_uRawUCatDsT is below 500.00mV
	[Defect Debouncing] • Defect condition exceeded cumulatively > 700.00ms • Failure is detected if active for 50% of the time
Fault healing	• The Sensed raw voltage value SCR_uRawUCatDsT is above 500.00mV
System reaction	• DEF catalyst downstream temperature is frozen at last valid value on preliminary failure and ramps to fixed replacement value 26.96°C {80.53°F} if failure is validated using slope 3300.00K/s or 3300.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID’s)
	• 1) FId / Replace Cat Downstream temperature with default value if failure is validated • 2) FId / Plausibilty check of temperature sensors at cold start not allowed • 3) Fid / Reagent dosing for SCR inhibited • 4) FId / Physical signal range check of temperature sensor 4 inhibited • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / Inhibit Physical Range Check of sensed Catalyst Downstream temperature
Failure cause	• Sensor defective or short circuit in wiring to ground
Failure repair	• Check wiring or replace sensor

3251-18: The value of component ‘B37 (DPF differential pressure sensor)’ is implausible. The minimum pressure was not reached.

Generation condition	[Test Condition] • The check is carried out continuously in the 100 ms interval if not inhibited by DINH_stFId.FId_PFltChar due to another failure. • There is no pending regeneration • The volume flow ASMod_dvolPFltEG lies above the threshold 500.00m^3/h
	[Fault Detection] • A failure is detected if the particulate filter differential pressure is below the monitoring threshold PFlt_pDiffCharMonMin_mp stored in the map PFlt_pDiffCharMonMin_MAP depending on the simulated soot mass and the exhaust volume flow.
	[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

System reaction		• None (only via inhibit handler)
		• 1) FId / Pressure Compensation of O2-Signal can not be learnt - is taken from the curve (LSU_facPresComLean_CUR) • 2) FId / Substitute calibration array is used to determinate the regeneration lock-out time of particulate filter (DPF) • 3) FId / Substitute parameter set of maximum values is used for the calculation of fuel consumption, operating hours and distance covered since the last successful regeneration of particulate filter (DPF) • 4) FId / Engine protection DPF regeneration inhibited due to faulty input signals • 5) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 6) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 7) FId / Inhibit DPF efficiency monitor • 8) FId / Interrupt DPF efficiency monitor • 9) FId / Inhibit monitor for DPF frequent regeneration • 10) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Filter is not installed or has an internal breakthrough
Failure repair		• Check filter for proper installation and function (no black smoke at exhaust pipe)
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3253-16: Plausibility check of component 'B28/8 (DPF differential pressure sensor)' Data Valid But Above Normal Operational Range.

Generation condition	[Test Condition] • Condition is tested during ECM after-run 2.00s, after turning key off.
	[Fault Detection] • The adapted raw differential pressure value Exh_pRawAdapPPFltDiff is above the tolerance limit 2.5kPa {0.4psi, 0.025kgf/cm^2}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 50% of the time
Fault healing	• The error is healed if the adapted raw pressure value is below the tolerance limit 2.5kPa {0.4psi, 0.025kgf/cm^2}

https://truckmanualshub.com/

System reaction		• None (Only via inhibit handler)
		• 1) FId / The Adaptation of lambda Sensor disabled • 2) FId / The adaptation values for Lambda Sensor stored in EEPROM are reset to • 3) FId / O2 Signal of Lambda Sensor not valid • 4) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 5) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 6) FId / Pressure Compensation of O2-Signal can not be learnt - is taken from the curve (LSU_facPresComLean_CUR) • 7) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 8) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 9) FId / Substitute calibration array is used to determinate the regeneration lock-out time of particulate filter (DPF) • 10) FId / Soot mass calculation of particulate filter (DPF) deactivated, only simulation is used. • 11) FId / Function inhibitor for frozen sensor detection. • 12) FId / Friction torque due to particulate filter (DPF) flow resistance set to • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) FId / Inhibit DPF efficiency monitor • 15) FId / Interrupt DPF efficiency monitor • 16) FId / Inhibit monitor for DPF frequent regeneration • 17) FId / Inhibit monitor for incomplete regeneration of the DPF • 18) FId / Engine protection DPF regeneration inhibited due to faulty input signals
Failure cause		• Differential pressure sensor is inaccurate.
Failure repair		• Check accuracy of differential pressure sensor.
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B37 (DPF differential pressure sensor). Check the circuit across B37.3/1 and A4.X2.94/22 for open or short circuit. Check the circuit across B37.3/3 and A4.X2.94/54 for open or short circuit. Check the circuit across B37.3/2 and A4.X2.94/18 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B37 (DPF differential pressure sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B37 (DPF differential pressure sensor) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

Inspection procedure	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3253-18: Hose Line connection check of component B28/8 (DPF differential pressure sensor).Data valid but below normal operational range

Generation condition		[Test Condition] • Condition is tested during ECM after-run, 2.00s after turning key off, if pressure sensor was tested and no failure was detected • and pressure sensor offset compensation is completed • ie Exh_stOfsCalcDnePPFltDiff_mp is set.
		[Fault Detection] • An error is detected if minimal steady differential pressure corrected with offset compensation (Exh_pMinStyPPFltDiff - Exh_pOfsValActMidPPFltDiff) is below -10kPa {-1.5psi, -0.1kgf/cm^2}. • Steady differential pressure is determined every time differential pressure variation is < 20kPa {2.9psi, 0.2kgf/cm^2} in a time window > 5.00s
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00ms • Failure is detected if active for 50% of the time
Fault healing		• Healing takes place if minimal steady differential pressure corrected with offset compensation is above -10kPa {-1.5psi, -0.1kgf/cm^2}. • Healing can only happen in the next afterrun.
System reaction		• None (Only via inhibit handler)
		• 1) FId / Pressure Compensation of O2-Signal can not be learnt - is taken from the curve (LSU_facPresComLean_CUR) • 2) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 3) FId / Substitute calibration array is used to determinate the regeneration lock-out time of particulate filter (DPF) • 4) FId / Substitute parameter set of maximum values is used for the calculation of fuel consumption, operating hours and distance covered since the last successful regeneration of particulate filter (DPF) • 5) FId / Engine protection DPF regeneration inhibited due to faulty input signals • 6) FId / Soot mass calculation of particulate filter (DPF) deactivated, only simulation is used. • 7) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 8) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 9) FId / Inhibit monitor for DPF frequent regeneration • 10) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Differential pressure sensor of filter upside down, hose lines crossed
Failure repair		• Check differential pressure sensor mounting and hose lines. • Reset offset drift compensation for diff.pressure sensor using dedicated UDS Routine Control Service (ID $0253)
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

3285-2: The result of the dynamic test of component '{0}' is not plausible.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • This error is set when the volume flow signal Exh_dvolFltPPFltDiff_mp and the differential pressure Exh_p-FltPPFltDiff does not have plausible behaviour. This means, the change of differential pressure • Exh_dpFltPPFltDiff_mp is smaller than the positive minimum value (Exh_dpPosDefPPFltDiff_mp) or greater than the negative minimum value (Exh_dpNegDefPPFltDiff_mp).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 900.00ms • Failure is detected if active for 50% of the time
Fault healing		• When the change of differential pressure is greater than or equal to the positive minimum value or smaller than or equal to the negative minimum value healing takes place.
System reaction		• This is a Signal Range Check (SRC). In case of a failure shall the OBD lamp be activated.
		• 1) FId / DPF differential pressure defective • 2) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 3) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF • 6) FId / Engine protection DPF regeneration inhibited due to faulty input signals • 7) FId / Trigger substitute function for PPFltDiff output in case of temporary SRC errors in particle-filter differential pressure. • 8) FId / Trigger substitute function for PPFltDiff output in case of permanent SRC errors in particle-filter differential pressure sensor.
Failure cause		• Dynamic plausibility check of the DPF differential pressure sensor. Possibly Pressure sensor failure, connection tubes or filter substrate.
Failure repair		• Please check differential pressure sensor as well as connection tubes. If failure remains, check particulate filter substrate if missing.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Pressure hose of B37 (DPF differential pressure sensor) Ceramic filter of Diesel particulate filter muffler Check DPF differential pressure hose; repair or replace it if there is a problem.Check DPF; repair or replace it if there is a problem.If DPF differential pressure hose has been corrected or replaced, perform the learned value resetting procedure of B37 (DPF differential pressure sensor) learned by A4 (Combustion engine Control unit).For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B37 (DPF differential pressure sensor). Check the circuit across B37.3/1 and A4.X2.94/22 for open or short circuit. Check the circuit across B37.3/3 and A4.X2.94/54 for open or short circuit. Check the circuit across B37.3/2 and A4.X2.94/18 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B37 (DPF differential pressure sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B37 (DPF differential pressure sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3285-17: Hose Line connection check of component Particle filter differential pressure sensor.Data valid but below normal operational range

Generation condition	[Test Condition] • if monitoring not inhibited by another failure (FId_PPFltDiffHsLnChk is not set)
	[Fault Detection] • If the filtered differential pressure signal Exh_pFltPPFltDiff is below the minimum value -2.5kPa {-0.4psi, -0.025kgf/cm^2}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None except FIds
	• 1) FId / DPF differential pressure defective • 2) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 3) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF • 6) FId / Engine protection DPF regeneration inhibited due to faulty input signals
Failure cause	• Hose connection upstream from the particle filter detached or completely blocked. • Atmospheric pressure is constantly present at the pressure connection upstream from the particle filter.
Failure repair	• Check mounting, check hose line

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Pressure hose of B37 (DPF differential pressure sensor) Check DPF differential pressure hose; repair or replace it if there is a problem. If DPF differential pressure hose has been corrected or replaced, perform the learned value resetting procedure of B37 (DPF differential pressure sensor) learned by A4 (Combustion engine Control unit). For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B37 (DPF differential pressure sensor). Check the circuit across B37.3/1 and A4.X2.94/22 for open or short circuit. Check the circuit across B37.3/3 and A4.X2.94/54 for open or short circuit. Check the circuit across B37.3/2 and A4.X2.94/18 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B37 (DPF differential pressure sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B37 (DPF differential pressure sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3287-0: Signal Range Check (SRC) for ‘B28/8 (DPF differential pressure sensor)’ reports Signal value above maximum limit.

Generation condition	[Test Condition] • ADC has not reported a module error (no failure “ADC...” active). Continuous Monitoring
	[Fault Detection] • The sensed raw voltage value Exh_uRawPPFltDiff is above 4.65V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1.80s • Failure is detected if active for 50% of the time

https://truckmanualshub.com/

Fault healing		• The sensed raw voltage value Exh_uRawPPFltDiff is below 4.65V
System reaction		• DPF differential pressure is frozen at last valid value on preliminary failure and ramps, using slope 10.001kPa {1.5psi, 0.1kgf/cm^2}/s or 10.001kPa {1.5psi, 0.1kgf/cm^2}/s depending whether the measured value is above or below replacement value, to a default value of -0.1kPa {-0.015psi, -0.001kgf/cm^2} if failure is validated. • Further reactions according FID (see FID's)
		• 1) FId / Inhibit enhanced SRC for particle filter differential pressure • 2) FId / Trigger substitute function for PPFltDiff output in case of temporary SRC errors in particle-filter differential pressure. • 3) FId / Trigger substitute function for PPFltDiff output in case of permanent SRC errors in particle-filter differential pressure sensor. • 4) FId / Engine protection DPF regeneration inhibited due to faulty input signals • 5) FId / Inhibit plausibility check for DPF differential pressure • 6) FId / The Adaptation of lambda Sensor disabled • 7) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 8) FId / The adaptation values for Lambda Sensor stored in EEPROM are reset to • 9) FId / O2 Signal of Lambda Sensor not valid • 10) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 11) FId / Pressure Compensation of O2-Signal can not be learnt - is taken from the curve (LSU_facPresComLean_CUR) • 12) FId / Inhibit monitor for DPF frequent regeneration • 13) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B37 (DPF differential pressure sensor). Check the circuit across B37.3/1 and A4.X2.94/22 for open or short circuit. Check the circuit across B37.3/3 and A4.X2.94/54 for open or short circuit. Check the circuit across B37.3/2 and A4.X2.94/18 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B37 (DPF differential pressure sensor)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B37 (DPF differential pressure sensor) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3287-1: Signal Range Check (SRC) for 'B28/8 (DPF differential pressure sensor)' reports Signal value below minimum limit.

Generation condition		[Test Condition] • ADC has not reported a module error (no failure "ADC..." active). Continuous Monitoring
		[Fault Detection] • The sensed raw voltage value Exh_uRawPPFltDiff is below 200.40mV
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.80s • Failure is detected if active for 50% of the time
Fault healing		• The sensed raw voltage value Exh_uRawPPFltDiff is above 200.40mV
System reaction		• DPF differential pressure is frozen at last valid value on preliminary failure and ramps, using slope 10.001kPa {1.5psi, 0.1kgf/cm^2}/s or 10.001kPa {1.5psi, 0.1kgf/cm^2}/s depending whether the measured value is above or below replacement value, to a default value of -0.1kPa {-0.015psi, -0.001kgf/cm^2} if failure is validated. • Further reactions according FID (see FID's)
		• 1) FId / Inhibit enhanced SRC for particle filter differential pressure • 2) FId / Trigger substitute function for PPFltDiff output in case of temporary SRC errors in particle-filter differential pressure. • 3) FId / Trigger substitute function for PPFltDiff output in case of permanent SRC errors in particle-filter differential pressure sensor. • 4) FId / Engine protection DPF regeneration inhibited due to faulty input signals • 5) FId / Inhibit plausibility check for DPF differential pressure • 6) FId / The Adaptation of lambda Sensor disabled • 7) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 8) FId / The adaptation values for Lambda Sensor stored in EEPROM are reset to • 9) FId / O2 Signal of Lambda Sensor not valid • 10) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 11) FId / Pressure Compensation of O2-Signal can not be learnt - is taken from the curve (LSU_facPresComLean_CUR) • 12) FId / Inhibit monitor for DPF frequent regeneration • 13) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Short circuit of wiring to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B37 (DPF differential pressure sensor). Check the circuit across B37.3/1 and A4.X2.94/22 for open or short circuit. Check the circuit across B37.3/3 and A4.X2.94/54 for open or short circuit. Check the circuit across B37.3/2 and A4.X2.94/18 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B37 (DPF differential pressure sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B37 (DPF differential pressure sensor) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3360-31: Cavity detected around SCR tank heater

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • tank heater was activated longer than an applicable time threshold 20.00s • Cavity check not inhibited by another failure (FId_UHCCavChkCalcRls is not set) • Tank temperature < 1.96°C {35.53°F}
		[Fault Detection] • A cavity will be detected if the present, filtered heater current UHC_iHtrTnkCavChkFlt_mp is less than the current threshold UHC_iCavChkLrnThresAvrgCor_mp. calculated from the learned current threshold UHC_iCavChkLrnThres_mp corrected by a • factor from the battery voltage based curve UHC_facBattUCavChkFltThres. • Cavity is detected longer than the debouncing time 60.00s,
		[Defect Debouncing] • Defect condition fulfilled continuously >50.0 ms
Fault healing		• No cavity detected
System reaction		• DEF dosing inhibited.
Failure cause		• During tank defrosting, DEF consumption is higher than DEF quantity that can be defrosted by tank heater.
Failure repair		• No repair intervention necessary.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

3361-3: SCR dosing valve: Voltage above normal or shorted to high source

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is active. • ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V), Battery voltage < 16.00V (switch off > 16.50V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
		[Fault Detection] • Hardware reports a short circuit to battery (SCB) error on the power stage for the DEF dosing Valve Actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.80s • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1000.00ms 5.00- times in actual driving cycle. Failure healed, if the power stage does not report a SCB error. Else no healing possible at this driving cycle.
System reaction		• Power stage is shut-off DEF dosing valve actuator in closed position). • Further reactions according FID (see FID's)
		• 1) Fid / Reagent dosing for SCR inhibited • 2) FId / Release of the SCRMon function/no emergency shut-off with emptying • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) FId / Inhibit DEF dosing valve plausibility check • 6) FId / Inhibit Physical Range Check of Tank Heater raw voltage
Failure cause		• Short circuit of wiring (Ground wire) to external source or inside DEF Dosing Valve Actuator
Failure repair		• Check of wiring or replace DEF Dosing Valve Actuator
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y7 (DEF metering device). Check the circuit across Y7.2/1 and A4.X2.94/25 for open or short circuit. Check the circuit across Y7.2/2 and A4.X2.94/29 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "Y7 (DEF metering device)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y7 (DEF metering device) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3361-4: SCR dosing valve: Voltage below normal or shorted to low source

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V), Battery voltage < 16.00V (switch off > 16.50V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
		[Fault Detection] • Hardware reports a short circuit to ground (SCG) error on the power stage for the DEF dosing Valve Actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• Hardware does not report a short circuit to ground (SCG) error on the power stage for the DEF dosing Valve Actuator.
System reaction		• Power stage is shut-off DEF dosing valve actuator in closed position). • Further reactions according FID (see FID's)
		• 1) Fid / Reagent dosing for SCR inhibited • 2) FId / Release of the SCRMon function/no emergency shut-off with emptying • 3) Fid / The DEF dosing System goes in Error mode after Emptying • 4) FId / Release of the SCRMon function/no emergency shut-off without emptying • 5) Fid / The DEF dosing system is forced to evacuate with fully opened Dosing valve • 6) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 7) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 8) FId / Inhibit DEF dosing valve plausibility check • 9) FId / Inhibit Physical Range Check of Tank Heater raw voltage
Failure cause		• Short circuit of wiring (Ground Wire) to ground or inside DEF Dosing Valve Actuator
Failure repair		• Check of wiring or replace DEF Dosing Valve Actuator
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y7 (DEF metering device). Check the circuit across Y7.2/1 and A4.X2.94/25 for open or short circuit. Check the circuit across Y7.2/2 and A4.X2.94/29 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "Y7 (DEF metering device)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y7 (DEF metering device) which A4 (Combustion engine Control unit) learns. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3361-5: SCR dosing valve: Current below normal or Open circuit

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is not active. • ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V), Battery voltage < 16.00V (switch off > 16.50V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
		[Fault Detection] • Hardware reports an open load (OL) error on power stage for the DEF dosing Valve Actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.80s • Failure is detected if active for 50% of the time
Fault healing		• Hardware does not report an open load (OL) error on power stage for the DEF dosing Valve Actuator.
System reaction		• Power stage is shut-off DEF dosing valve actuator in closed position). • Further reactions according FID (see FID's)
		• 1) Fid / Reagent dosing for SCR inhibited • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Release of the SCRMon function/no emergency shut-off with emptying • 4) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 5) FId / Inhibit DEF dosing valve plausibility check • 6) FId / Inhibit Physical Range Check of Tank Heater raw voltage
Failure cause		• Broken or disconnected wiring or defective DEF Dosing Valve Actuator
Failure repair		• Check of wiring, replace DEF Dosing Valve Actuator
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y7 (DEF metering device). Check the circuit across Y7.2/1 and A4.X2.94/25 for open or short circuit. Check the circuit across Y7.2/2 and A4.X2.94/29 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y7 (DEF metering device)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y7 (DEF metering device) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3361-7: SCR dosing valve: Mechanical system not responding or out of adjustment

Generation condition	[Test Condition] • Monitoring not inhibited by FID_SCRPODPlausUDosVlv due to another failure. • The System must be ready for DEF injection (State “Pressure Control” / Sub state “Metering control”) • Ambient pressure between 74kPa {11psi, 0.8kgf/cm^2} and 130kPa {19psi, 1.3kgf/cm^2}. • Battery Voltage between 10.00V and 16.00V. • DEF pressure between 0kPa {0psi, 0kgf/cm^2} and 1MPa {145psi, 10kgf/cm^2}. • Coil temperature of DEF injection valve between -0.04°C {31.93°F} and 119.96°C {247.93°F}.
	[Fault Detection] • The Dosing valve driver reports an opening error “stNoOpnErr” because no BIP was detected during 10.00- injection cycles.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 150.00 events • Failure is detected if active for 50% of events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• System switches off: Pump OFF, 4/2 Valve opens (to empty the system) • Possibly power reduction to prevent overheating of dosing valve (as it can not be cooled by DEF injection) • Further reactions according FID (see FID’s)
	• 1) FId / Reagent dosing for SCR inhibited • 2) FId / Release of the SCRMon function/no emergency shut-off with emptying • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause	• Dosing valve blocked mechanically (or frozen)
Failure repair	• Check if dosing valve opens. • Check if tube between pump and dosing valve is free.

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3361-12: SCR dosing valve: Overtemperature

Generation condition		[Test Condition] • Monitoring only when the power stage is active. • ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V), Battery voltage < 16.00V (switch off > 16.50V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
		[Fault Detection] • Hardware reports an excess temperature (OT) error on the power stage for the DEF dosing Valve Actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 5.00s 5.00- times in actual driving cycle. Failure healed, if the power stage does not report an OT error. Else no healing possible at this driving cycle.
System reaction		• Power stage is shut-off DEF dosing valve actuator in closed position). • Further reactions according FID (see FID's)
		• 1) Fid / Reagent dosing for SCR inhibited • 2) FId / Release of the SCRMon function/no emergency shut-off with emptying • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) FId / Inhibit DEF dosing valve plausibility check • 6) FId / Inhibit Physical Range Check of Tank Heater raw voltage
Failure cause		• High battery voltage, high ECU temperature and high load or defective wiring, power stage or DEF Dosing Valve Actuator defective
Failure repair		• Check battery voltage, wiring, power stage and DEF Dosing Valve Actuator.
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y7 (DEF metering device). Check the circuit across Y7.2/1 and A4.X2.94/25 for open or short circuit. Check the circuit across Y7.2/2 and A4.X2.94/29 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "Y7 (DEF metering device)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Y7 (DEF metering device) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3361-18: The emission value of the NOx sensor (raw value) is too high.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • NOx Sensor Ready and Reagent Dosing released for at least 1000.00ms, i.e.:, Engine Temperature evaluation not inhibited by FDI_DStgyCengDsT due to another failure, Engine temperature > 39.96°C {103.93°F}, Expected SCR efficiency > 0.30-, NOx Sensor released by FID_DStgyStatNOxSens, Dosing system Ready for Reagent injection, No DPF Regeneration active and SCR Monitoring not inhibited by FID_DStgyMon due to another failure • Fuel Injection quantity in a range defined by 2 curves engine speed dependent (DStgy_qCatEffLimMin DStgy_qCatEffLimMax) • Ambient Temperature between -100.04°C {-148.07°F} and 99.96°C {211.93°F} • Engine Temperature between 59.96°C {139.93°F} and 111.96°C {233.53°F} • Ambient pressure > 75kPa {11psi, 0.8kgf/cm^2}, i.e. not in too high altitude
	[Fault Detection] • SCR efficiency ratio "expected/measured" Filtered value > defined threshold, failure is detected
	[Defect Debouncing] • Defect condition fulfilled continuously >100000.0 ms
Fault healing	• SCR efficiency ratio "expected/measured" Filtered value < defined threshold failure is healed
System reaction	• According FID (see FID's) • European Heavy Duty application: One or more Long Time Failures OBD-GenFaultLct stored, which can not be erased by tester during 400 days.
	• 1) FId / Require NOx sensor plausibility test • 2) FId / failure in a component for determination of NOx estimation
Failure cause	• Reagent with too low DEF concentration (<<32%) • Too low or no Reagent injection • Wrong NOx measurement (NOx Sensor measures too high values) • Engine NOx raw emissions higher than expected (humidity sensor measures too humid air, injection timing anticipated, fuel pressure sensor measures too low fuel pressure.)
Failure repair	• Check Reagent, if correct concentration • Check Dosing quantity of SCR system • Check if engine raw emissions are OK (e.g. drive vehicle at constant speed without Reagent injection and compare measured with estimated NOx with tester), if not check: • NOx Sensor • Humidity Sensor • Fuel pressure sensor • Injection timing • If OK, repeat test WITH Reagent dosing and check Closed Loop Control parameter: if continuously < 0.7 or > 1.3 --> risk of NH3 slip due to system problem.

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check that the DEF concentration is appropriate and, if the concentration is not appropriate, replace DEF. Perform control and make sure that appropriate DEF can be added. For procedures, refer to the Shop Manual Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with B27 (Humidity and temperature sensor “Intake air”) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B51 (Rail pressure sensor) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and B31.5/4 for open or short circuit. Check the circuit across A4.X2.94/61 and B31.5/3 for open or short circuit. Check the circuit across A20.X10.14/2 and B31.5/1 for open or short circuit. Check the circuit across B31.5/2 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step9
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step8
	Step8	Inspection completed
	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and X42.8/3 for open or short circuit. Check the circuit across A4.X2.94/61 and X42.8/2 for open or short circuit. Check the circuit across A20.X10.14/2 and X42.8/4 for open or short circuit. Check the circuit across X42.8/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Repair or replace the harness across B29 (Oxygen sensor) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step11	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5

3362-0: SCR Reagent pump: DEF pump pressureHIGH

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • ECU Hardware does not report an ADC failure.
	[Fault Detection] • The Sensed raw voltage value > 2.82V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• According FID (see FID's) and • Value is frozen at the last valid value during debouncing. After debouncing it ramps with 330kPa {48psi, 3.4kgf/cm^2}/s (upwards) or 330kPa {48psi, 3.4kgf/cm^2}/s (downwards) to replacement value 200kPa {29psi, 2.0kgf/cm^2}. • After healing signal ramps from 200kPa {29psi, 2.0kgf/cm^2} to actual value with same slopes.
	• 1) Fid / Reagent dosing for SCR inhibited • 2) FId / Freeze abs.DEF pressure value if preliminary failure detected • 3) FId / Function Identifier to determine, when the sensed value is to be replaced with a default when the signal source is ADC FId_RplValAbsUPmpP • 4) FId / Release of the SCRMon function/no emergency shut-off with emptying • 5) FId / Inhibit Physical Range Check of Pump Module Pressure Sensor • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 7) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 8) FId / Inhibit DEF dosing valve plausibility check • 9) FId / Inhibit reverting valve plausibility check • 10) Pressure reduction of reagent dosing system inhibited
Failure cause	• Short circuit of sensor to external source or defective sensor
Failure repair	• Check wiring and sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B30 (DEF pressure sensor). Check the circuit across A4.X2.94/79 and B30.3/3 for open or short circuit. Check the circuit across A4.X2.94/77 and B30.3/2 for open or short circuit. Check the circuit across A4.X2.94/43 and B30.3/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19. Check the circuit across A4.X2.94/43 and X19.16/12 for open or short circuit. Check the circuit across A4.X2.94/77 and X19.16/11 for open or short circuit. Check the circuit across A4.X2.94/79 and X19.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step8
	Step7	Inspection procedure Repair or replace the harness across B30 (DEF pressure sensor) and X19. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2
	Step8	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "A40 (DEF tank)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19. Check the circuit across A4.X2.94/43 and X19.16/12 for open or short circuit. Check the circuit across A4.X2.94/77 and X19.16/11 for open or short circuit. Check the circuit across A4.X2.94/79 and X19.16/11 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step8
	Step7	Inspection procedure Repair or replace the harness across B30 (DEF pressure sensor) and X19. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2
	Step8	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3362-7: SCR reverting valve: Mechanical system not responding or out of adjustment

Generation condition	[Test Condition] • Monitoring not inhibited by FID_SCRPODPlausURevVlv due to another failure. • System entered into PRESSUREREDUCTION state (reverting valve actuated, pump set to 15.00% and dosing valve fully closed) with DEF pressure > 400kPa {58psi, 4.1kgf/cm^2}.
	[Fault Detection] • The DEF pressure drop down is < 300kPa {44psi, 3.1kgf/cm^2} during “pressure reduction” phase, i.e. within 5.50s
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing	• No healing at this driving cycle.
System reaction	• During afterrun pump OFF, open UDV temporarily. • Further reaction according FID (see FID’s)
	• 1) Fid / The DEF dosing System goes in Error mode after Emptying
Failure cause	• Reverse valve does not work (blocked closed). • Back flow tube into tank clogged. • DEF pressure sensor stuck.
Failure repair	• Check if Back flow tube free. • Check if Reverse valve works with tester: set DEF pressure to 500kPa {73psi, 5.1kgf/cm^2} (dosing valve closed) - wait until pressure stable - actuate reverse valve --> if pressure does not drop down --> reverse valve does not work.

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'Y20 (DEF switchover valve)' is stuck. Plugged A40 (DEF tank) Component 'B30 (DEFpressure sensor)' is faulty. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y20 (DEF switchover valve). Remove the connector of A20 (SAM). Check the circuit across A20.X10.14/2 and Y20.2/1 for open or short circuit. Check the circuit across A4.X2.94/73 and Y20.2/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component "A40 (DEF tank)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'Y20 (DEF switchover valve)' is stuck. Plugged A40 (DEF tank) Component 'B30 (DEF pressure sensor)' is faulty. For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/73 and X19.16/9 for open or short circuit. Check the circuit across A20.X10.14/2 and X19.16/8 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Inspection procedure Repair or replace the harness across Y20 (DEFswitchover valve) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

3363-0: SCR Reagent heating: DEF tank heater diagnostic signalHIGH

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously, if ADC module does not report any error.
	[Fault Detection] • The Sensed raw voltage > 3.20V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 50.00ms • Failure is detected if active for 50% of the time
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• Raw voltage is frozen at last valid value on preliminary failure and ramps to fixed replacement value 41.00uA if failure is validated using slope 3300.00K/s or 3300.00K/s depending on whether the replacement value is above or below the current value • Further reactions according FID (see FID's)
	• 1) FId / Inhibit Monitoring of Tank Heater Circuit • 2) FId / Disable the sending of TESTING signal for heater Tank • 3) FId / Tank heating not released • 4) FId / Freeze DEF tank heater raw voltage if preliminary failure is detected • 5) FId / Inhibit Physical Range Check of Tank Heater raw voltage • 6) FId / Replace DEF tank heater raw voltage with default value if failure is validated
Failure cause	• Wiring harness (short circuit) • Relay defect • DEF Tank heater element defect
Failure repair	• Check Wiring harness (short circuit) • Check Relay • Check DEF Tank heater element

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of R3 (DEF heater power unit). Remove the connector of R5 (DEF tank heater). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/28 and R3.X2.4/4 for open or short circuit. Check the circuit across A4.X2.94/32 and R3.X2.4/3 for open or short circuit. Check the circuit across A4.X2.94/50 and R3.X2.4/2 for open or short circuit. 3363-2: SCR Reagent heating: No load-Data erratic, intermittent or incorrect

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V), Battery voltage < 16.00V (switch off > 16.50V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power stage not switched off, i.e. ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V) and Battery voltage < 16.00V (switch off > 16.50V)
	[Fault Detection] • Hardware reports an Open Load (OL) error on the power stage for the power stage of DEF Tank heater
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Hardware does not report an Open Load (OL) error on the power stage for the power stage of DEF Tank heater
System reaction	• Power stage is shut off. • Further reactions according FID (see FID's)
	• 1) FId / Function Identifier to inhibit the check for response of DEF tank heater in case of heater and temperature sensor errors. • 2) FId / Disable the sending of TESTING signal for heater Tank • 3) FId / Tank heating not released
Failure cause	• Broken or disconnected wiring or defective DEF Tank Heater
Failure repair	• Check of wiring, replace DEF Tank Heater

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of R3 (DEF heater power unit). Remove the connector of R5 (DEF tank heater). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/28 and R3.X2.4/4 for open or short circuit. Check the circuit across A4.X2.94/32 and R3.X2.4/3 for open or short circuit. Check the circuit across A4.X2.94/50 and R3.X2.4/2 for open or short circuit. Check the circuit across A4.X2.94/10 and R3.X2.4/1 for open or short circuit. Check the circuit across R3.X1.5/4 and B36.4/2 for open or short circuit. Check the circuit across R3.X1.5/3 and A20.X10.14/4 for open or short circuit. Check the circuit across R3.X1.5/5 and A20.X10.14/6 for open or short circuit. Check the circuit across B36.4/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “R5 (DEF tank heater)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “R3 (DEF heater power unit)”. Reinstall all the removed connectors. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step10
	Step10	Inspection completed
	Step11	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19 (Intermediate connector). Remove the connector of X41 (Intermediate connector). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/28 and X19.16/4 for open or short circuit. Check the circuit across A4.X2.94/32 and X19.16/3 for open or short circuit. Check the circuit across A4.X2.94/50 and X19.16/1 for open or short circuit. Check the circuit across A4.X2.94/10 and X19.16/2 for open or short circuit. Check the circuit across X41.4/3 and Ground for open or short circuit. Check the circuit across X41.4/2 and A20.X10.14/4 for open or short circuit. Check the circuit across X41.4/1 and A20.X10.14/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Inspection procedure Repair or replace the harness across R3 (DEF heater power unit) and X19 (Intermediate connector). Repair or replace the harness across R3 (DEF heater power unit) and X19 (Intermediate connector). Repair or replace the harness across R3 (DEF heater power unit) and R5 (DEF tank heater). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19 (Intermediate connector). Repair or replace the harness across A20 (SAM) and X41 (Intermediate connector). Repair or replace the harness across Ground and X41 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

https://truckmanualshub.com/

3363-3: SCR Reagent heating: Voltage above normal or shorted to high source

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is active. • ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V), Battery voltage < 16.00V (switch off > 16.50V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power stage not switched off, i.e. ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V) and Battery voltage < 16.00V (switch off > 16.50V)
		[Fault Detection] • Hardware reports a short circuit to battery (SCB) error on the power stage for the power stage of DEF Tank heater
		[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1000.00ms 5.00- times in actual driving cycle. Failure healed, if the power stage does not report an SCB error. Else no healing possible at this driving cycle.
System reaction		• Power stage is shut off. • Test impulse is sent to power stage via SPI. • Further reactions according FID (see FID's)
		• 1) Fid / Function Identifier to inhibit the check for response of DEF tank heater in case of heater and temperature sensor errors. • 2) FId / Disable the sending of TESTING signal for heater Tank • 3) FId / Tank heating not released
Failure cause		• Short circuit of wiring to external source or inside DEF Tank Heater
Failure repair		• Check of wiring, replace DEF Tank Heater
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of R3 (DEF heater power unit). Remove the connector of R5 (DEF tank heater). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/28 and R3.X2.4/4 for open or short circuit. Check the circuit across A4.X2.94/32 and R3.X2.4/3 for open or short circuit. Check the circuit across A4.X2.94/50 and R3.X2.4/2 for open or short circuit. Check the circuit across A4.X2.94/10 and R3.X2.4/1 for open or short circuit. Check the circuit across R3.X1.5/4 and B36.4/2 for open or short circuit. Check the circuit across R3.X1.5/3 and A20.X10.14/4 for open or short circuit. Check the circuit across R3.X1.5/5 and A20.X10.14/6 for open or short circuit. Check the circuit across B36.4/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "R5 (DEF tank heater)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “R3 (DEF heater power unit)”. Reinstall all the removed connectors. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step10
	Step10	Inspection completed
	Step11	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19 (Intermediate connector). Remove the connector of X41 (Intermediate connector). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/28 and X19.16/4 for open or short circuit. Check the circuit across A4.X2.94/32 and X19.16/3 for open or short circuit. Check the circuit across A4.X2.94/50 and X19.16/1 for open or short circuit. Check the circuit across A4.X2.94/10 and X19.16/2 for open or short circuit. Check the circuit across X41.4/3 and Ground for open or short circuit. Check the circuit across X41.4/2 and A20.X10.14/4 for open or short circuit. Check the circuit across X41.4/1 and A20.X10.14/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13

https://truckmanualshub.com/

Inspection procedure	Step12	Inspection procedure Repair or replace the harness across R3 (DEF heater power unit) and X19 (Intermediate connector). Repair or replace the harness across R3 (DEF heater power unit) and X19 (Intermediate connector). Repair or replace the harness across R3 (DEF heater power unit) and R5 (DEF tank heater). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19 (Intermediate connector). Repair or replace the harness across A20 (SAM) and X41 (Intermediate connector). Repair or replace the harness across Ground and X41 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

3363-4: SCR Reagent heating: Voltage below normal or shorted to low source

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V), Battery voltage < 16.00V (switch off > 16.50V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power stage not switched off, i.e. ECU not in pre drive condition, Battery voltage > 9.50V (switch off < 9.00V) and Battery voltage < 16.00V (switch off > 16.50V)
		[Fault Detection] • Hardware reports a short circuit to ground (SCG) error on the power stage for the power stage of DEF Tank heater
		[Defect Debouncing] • Defect condition exceeded immediately
Fault healing		• Hardware does not report a short circuit to ground (SCG) error on the power stage for the power stage of DEF Tank heater
System reaction		• Power stage is shut off. • Further reactions according FID (see FID's)
		• 1) FId / Function Identifier to inhibit the check for response of DEF tank heater in case of heater and temperature sensor errors. • 2) FId / Inhibit Monitoring of Tank Heater Circuit • 3) FId / Disable the sending of TESTING signal for heater Tank • 4) FId / Tank heating not released
Failure cause		• Short circuit of wiring to ground or inside DEF Tank Heater
Failure repair		• Check of wiring, replace DEF Tank Heater
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of R3 (DEF heater power unit). Remove the connector of R5 (DEF tank heater). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/28 and R3.X2.4/4 for open or short circuit. Check the circuit across A4.X2.94/32 and R3.X2.4/3 for open or short circuit. Check the circuit across A4.X2.94/50 and R3.X2.4/2 for open or short circuit. Check the circuit across A4.X2.94/10 and R3.X2.4/1 for open or short circuit. Check the circuit across R3.X1.5/4 and B36.4/2 for open or short circuit. Check the circuit across R3.X1.5/3 and A20.X10.14/4 for open or short circuit. Check the circuit across R3.X1.5/5 and A20.X10.14/6 for open or short circuit. Check the circuit across B36.4/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “R5 (DEF tank heater)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “R3 (DEF heater power unit)”. Reinstall all the removed connectors. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step10

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection completed
	Step11	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19 (Intermediate connector). Remove the connector of X41 (Intermediate connector). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/28 and X19.16/4 for open or short circuit. Check the circuit across A4.X2.94/32 and X19.16/3 for open or short circuit. Check the circuit across A4.X2.94/50 and X19.16/1 for open or short circuit. Check the circuit across A4.X2.94/10 and X19.16/2 for open or short circuit. Check the circuit across X41.4/3 and Ground for open or short circuit. Check the circuit across X41.4/2 and A20.X10.14/4 for open or short circuit. Check the circuit across X41.4/1 and A20.X10.14/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Inspection procedure Repair or replace the harness across R3 (DEF heater power unit) and X19 (Intermediate connector). Repair or replace the harness across R3 (DEF heater power unit) and X19 (Intermediate connector). Repair or replace the harness across R3 (DEF heater power unit) and R5 (DEF tank heater). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19 (Intermediate connector). Repair or replace the harness across A20 (SAM) and X41 (Intermediate connector). Repair or replace the harness across Ground and X41 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

https://truckmanualshub.com/

3363-12: DEF tank heater is faulty.

Generation condition		[Test Condition] • Monitoring not inhibited by FID_SCRPODRplValUTnkT due to another failure. • Tank heater active • Vehicle speed VehV_v > 10km/h {6.2mph} • Remaining DEF tank content UDC_rRdcAgRmn > 31.99% • Internal release delay 60.00s has expired • DEF tank temperature is outside of range -17.04°C {1.33°F} and -8.04°C {17.53°F}
		[Fault Detection] • DEF temperature does not increase by • 1.96°C {35.53°F} at -32.04°C {-25.67°F} • 1.96°C {35.53°F} at -20.04°C {-4.07°F} • 0.96°C {33.73°F} at -12.04°C {10.33°F} • 0.96°C {33.73°F} at -2.04°C {28.33°F} • within • 15.00min at -32.04°C {-25.67°F} • 48.00min at -20.04°C {-4.07°F} • 60.00min at -12.04°C {10.33°F} • 60.00min at -2.04°C {28.33°F}
		[Defect Debouncing] • Immediate
Fault healing		• Healing of fault is only possible over a new fault free heating cycle at new driving cycle
System reaction		• None
Failure cause		• Heater in “air bubble” with frozen DEF --> check ambient conditions, if failure happened at temp < -10°{14°F} --> possible reason. • Tank heater defect • Wiring harness defect
Failure repair		• Check tank heater • Check wiring harness
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. If this fault code occurs under conditions of -10°C {14°F} or less, the fault may be transient; check the environment where the fault code occurs. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of R3 (DEF heater power unit). Remove the connector of R2 (DEF line heater). Remove the connector of A18 (DEF delivery pump). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/28 and R3.X2.4/4 for open or short circuit. Check the circuit across A4.X2.94/32 and R3.X2.4/3 for open or short circuit. Check the circuit across A4.X2.94/50 and R3.X2.4/2 for open or short circuit. Check the circuit across A4.X2.94/10 and R3.X2.4/1 for open or short circuit. Check the circuit across R3.X1.5/1 and R2.2/1 for open or short circuit. Check the circuit across R3.X1.5/2 and A18.5/2 for open or short circuit. Check the circuit across R3.X1.5/3 and A20.X10.14/4 for open or short circuit. Check the circuit across R3.X1.5/5 and A20.X10.14/6 for open or short circuit. Check the circuit across R2.2/2 and Ground for open or short circuit. Check the circuit across A18.5/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “R2 (DEF line heater)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “R3 (DEF heater power unit)”. Reinstall all the removed connectors. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A40 (DEF tank)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A40 (DEF tank) which A4 (Combustion engine Control unit) learns. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step10
	Step10	Inspection completed
	Step11	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X19 (Intermediate connector). Remove the connector of X41 (Intermediate connector). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/28 and X19.16/4 for open or short circuit. Check the circuit across A4.X2.94/32 and X19.16/3 for open or short circuit. Check the circuit across A4.X2.94/50 and X19.16/1 for open or short circuit. Check the circuit across A4.X2.94/10 and X19.16/2 for open or short circuit. Check the circuit across X41.4/3 and Ground for open or short circuit. Check the circuit across X41.4/4 and Ground for open or short circuit. Check the circuit across X41.4/1 and A20.X10.14/4 for open or short circuit. Check the circuit across X41.4/2 and A20.X10.14/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13

https://truckmanualshub.com/

Inspection procedure	Step12	Inspection procedure Repair or replace the harness across R3 (DEF heater power unit) and X19 (Intermediate connector). Repair or replace the harness across R3 (DEF heater power unit) and X19 (Intermediate connector). Repair or replace the harness across R3 (DEF heater power unit) and A18 (DEF delivery pump). Repair or replace the harness across R3 (DEF heater power unit) and R2 (DEF line heater). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X19 (Intermediate connector). Repair or replace the harness across A20 (SAM) and X41 (Intermediate connector). Repair or replace the harness across Ground and X41 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

3470-3: Component ‘VTG Actuator’ has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is active.
	[Fault Detection] • Hardware reports “short circuit to battery” (SCB) error
	[Defect Debouncing] • Defect condition exceeded cumulatively > 480.00ms • Failure is detected if active for 50% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage each 250.00ms. Failure healed, if the power stage does not report an SCB error.

https://truckmanualshub.com/

		• Power stage shut off (VGT actuator in open position). • Further reactions according FID (see FID's)
System reaction		• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 5) FId / Status of function identifier FId_EngDemTrqLimErr1 • 6) FId / Torque limitation 2 activated for power reduction • 7) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 8) FId / The Adaptation of lambda Sensor disabled • 9) FId / The Difference Check between several Lambda Sensors is disabled • 10) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 11) FId / Electrical Open Load Check of Lambda Sensor disabled • 12) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 13) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 14) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 15) FId / CLosed Loop Boost pressure governor shut off due to a Sytem error • 16) FId / Inhibit DPF monitor • 17) FId / Particulate filter ((DPF) Regeneration inhibited • 18) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 19) FId / PI controller of VGT position bypassed and only Pre Control map used (open loop control) • 20) FId / Offset learning of VGT position sensor at Afterrun disabled • 21) FId / Inhibit Charged Air Cooler monitoring • 22) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled
Failure cause		• Short circuit of wiring to external source or inside PWM actuator
Failure repair		• Check of wiring, replace PWM actuator
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y21 (Actuator in turbocharger). Remove the connector of A20 (SAM). Check the circuit across Y21.2/2 and A20.X10.14/2 for open or short circuit. Check the circuit across Y21.2/1 and A4.X1.60/19 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "Y21 (Actuator in turbocharger)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Turbocharger which A1 ECU learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3470-4: Component 'VTG Actuator' has a short circuit to ground.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
	[Fault Detection] • Hardware reports "short to ground" (SCG) error
	[Defect Debouncing] • Defect condition exceeded cumulatively > 480.00ms • Failure is detected if active for 50% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage each 250.00ms. Failure healed, if the power stage does not report an SCG error.
System reaction	• Power stage shut off (VGT actuator in open position). • Further reactions according FID (see FID's)
	• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 5) FId / Status of function identifier FId_EngDemTrqLimErr1 • 6) FId / Torque limitation 2 activated for power reduction • 7) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 8) FId / The Adaptation of lambda Sensor disabled • 9) FId / The Difference Check between several Lambda Sensors is disabled • 10) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 11) FId / Electrical Open Load Check of Lambda Sensor disabled • 12) FId / O2 Signal of Lambda Sensor not valid • 13) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 14) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 15) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 16) FId / CLosed Loop Boost pressure governor shut off due to a Sytem error • 17) FId / Inhibit DPF monitor • 18) FId / Particulate filter ((DPF) Regeneration inhibited • 19) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 20) FId / PI controller of VGT position bypassed and only Pre Control map used (open loop control) • 21) FId / Offset learning of VGT position sensor at Afterrun disabled • 22) FId / Inhibit Charged Air Cooler monitoring • 23) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled
Failure cause	• Short circuit of wiring to ground or inside PWM
Failure repair	• Check of wiring, replace PWM actuator

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y21 (Actuator in turbocharger). Remove the connector of A20 (SAM). Check the circuit across Y21.2/2 and A20.X10.14/2 for open or short circuit. Check the circuit across Y21.2/1 and A4.X1.60/19 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y21 (Actuator in turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Turbocharger which A1 ECU learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3470-5: Component VTG Actuator has a current below normal or Open circuit.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • Open load diagnosis can be asked by another failure activating Fld_TrbChOpnLd.
	[Fault Detection] • Hardware reports “open load” (OL) error
	[Defect Debouncing] • Defect condition exceeded cumulatively > 480.00ms • Failure is detected if active for 50% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage each 250.00ms. Failure healed, if the power stage does not report an OL error.

		• Power stage shut off (VGT actuator in open position). • Further reactions according FID (see FID's)
System reaction		• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 5) FId / Status of function identifier FId_EngDemTrqLimErr1 • 6) FId / Torque limitation 2 activated for power reduction • 7) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 8) FId / The Adaptation of lambda Sensor disabled • 9) FId / The Difference Check between several Lambda Sensors is disabled • 10) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 11) FId / Electrical Open Load Check of Lambda Sensor disabled • 12) FId / O2 Signal of Lambda Sensor not valid • 13) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 14) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 15) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 16) FId / CLosed Loop Boost pressure governor shut off due to a Sytem error • 17) FId / Inhibit DPF monitor • 18) FId / Particulate filter ((DPF) Regeneration inhibited • 19) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 20) FId / PI controller of VGT position bypassed and only Pre Control map used (open loop control) • 21) FId / Offset learning of VGT position sensor at Afterrun disabled • 22) FId / Inhibit Charged Air Cooler monitoring • 23) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled
Failure cause		• Broken or disconnected wiring, defective PWM actuator
Failure repair		• Check of wiring, replace PWM actuator
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y21 (Actuator in turbocharger). Remove the connector of A20 (SAM). Check the circuit across Y21.2/2 and A20.X10.14/2 for open or short circuit. Check the circuit across Y21.2/1 and A4.X1.60/19 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "Y21 (Actuator in turbocharger)". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Turbocharger which A1 ECU learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3470-12: Component 'VTG Actuator' signals overtemperature.

Generation condition		[Test Condition] • Monitoring only when the power stage is active.
		[Fault Detection] • Hardware reports "over temperature" (OT) error
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 0.25s. Failure healed, if the power stage does not report an OT error.
System reaction		• Power stage shut off (VGT actuator in open position). • Further reactions according FID (see FID's)
		• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 4) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 5) FId / Status of function identifier FId_EngDemTrqLimErr1 • 6) FId / Torque limitation 2 activated for power reduction • 7) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 8) FId / The Adaptation of lambda Sensor disabled • 9) FId / The Difference Check between several Lambda Sensors is disabled • 10) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 11) FId / Electrical Open Load Check of Lambda Sensor disabled • 12) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 13) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 14) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 15) FId / Inhibit DPF monitor • 16) FId / Particulate filter ((DPF) Regeneration inhibited • 17) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 18) FId / CLosed Loop Boost pressure governor shut off due to a Sytem error • 19) FId / Inhibit Charged Air Cooler monitoring • 20) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled
Failure cause		• High battery voltage, high ECU temperature and high load or defective wiring, power stage or VGT actuator
Failure repair		• Check wiring, power stage and VGT actuator
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y21 (Actuator in turbocharger). Remove the connector of A20 (SAM). Check the circuit across Y21.2/2 and A20.X10.14/2 for open or short circuit. Check the circuit across Y21.2/1 and A4.X1.60/19 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “Y21 (Actuator in turbocharger)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Turbocharger which A1 ECU learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y21 (Actuator in turbocharger). Remove the connector of A20 (SAM). Check the circuit across Y21.2/2 and A20.X10.14/2 for open or short circuit. Check the circuit across Y21.2/1 and A4.X1.60/19 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step4

3517-1: DEF tank levelData valid but below normal operational range

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • If the calculation of the tank level reaches a value of 0 (= EMPTY), an error message will be issued.
	[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing	• Calculated Tank level > 0
System reaction	• None except FIDs
	• 1) FId / Reagent dosing for SCR inhibited
Failure cause	• Tank is empty
Failure repair	• Refill DEF tank

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3597-0: ECU voltage supply: OVERVOLTAGE

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • If voltage supply exceeds internal maximal limit
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Voltage supply below maximal limit
System reaction		• None
Failure cause		• Excessive voltage supply of a CJ945 component: High battery voltage, defective wiring, internal defect of the ECM
Failure repair		• Check the battery for correct voltage supply, check wiring. If defect remains replace ECM (internal defect)
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Check the circuit across A20.X10.14/7 and A4.X2.94/1 for open or short circuit. Check the circuit across A20.X10.14/10 and A4.X2.94/3 for open or short circuit. Check the circuit across A20.X10.14/9 and A4.X2.94/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A20 (SAM) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

3597-1: ECU voltage supply: UNDERVOLTAGE

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • If voltage supply below internal minimal limit
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Voltage supply above minimal limit
System reaction		• None
Failure cause		• Insufficient voltage supply of a CJ945 component: Low battery voltage, defective wiring, internal defect of the ECM
Failure repair		• Check the battery for sufficient voltage supply, check wiring. If defect remains replace ECM (internal defect)
Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A20 (SAM). Check the circuit across A20.X10.14/7 and A4.X2.94/1 for open or short circuit. Check the circuit across A20.X10.14/10 and A4.X2.94/3 for open or short circuit. Check the circuit across A20.X10.14/9 and A4.X2.94/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Perform the operation start and replace A20 (SAM). Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A20 (SAM) which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

3597-12: ECU power stage1: Supply for sensors: Accelerator pedal1, Camshaft, SCR reagent pressure,VGT speed, VGT actuator position

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • The sensor supply voltage is monitored by an HW comparator. If the sensor supply voltage lies outside of the switching thresholds, a fault is output. The detection thresholds are defined by the hardware and cannot be calibrated.
	[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing	• The supply voltage must lie within the thresholds.
System reaction	• None except FIDs
	• 1) FId / Limited engine speed because of accelerator pedal error • 2) FId / Increased engine speed because of accelerator pedal error • 3) FId / Final defect of acceleration pedal signal 1 detected - APP1 Signal not useable • 4) FId / Provisional defect of acceleration pedal signal 1 detected - APP1 Signal frozen until final defect or healing detected • 5) FId / Electr Signal range check SRC for Accelerator Pedal 1 APP1 disabled • 6) FId / Preceding provisional errors in the signal chain of acceleration pedal signal 1 detected • 7) FId / SRC High on APP1 detected --> APP1 Signal not useable • 8) FId / Synchronisation check of acceleration pedal disabled • 9) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 10) FId / Status of function identifier FId_EngDemTrqLimErr1 • 11) FId / Torque limitation 2 activated for power reduction • 12) FId / Cam Shaft signal for engine speed sensing not used (back up mode w.o. Cam Shaft signal) • 13) FId / Camshaft position adaption (learning of real position to the theoretical one) inhibited • 14) FId / Camshaft sensor diagnosis inhibited (due to sensor supply error) • 15) FId / Camshaft offset diagnosis inhibited (due camshaft or crankshaft signal errors) • 16) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 17) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 18) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 19) FId / Freeze abs.DEF pressure value if preliminary failure detected • 20) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 21) FId / Single Injector shut off test inhibited • 22) FId / Run Up test inhibited • 23) FId / Set point test of Metering Unit (MeUn) of Common Rail disabled • 24) FId / CLosed Loop Boost pressure governor shut off due to a System error • 25) FId / Fuel rail pressure control valve (PCV) set point test inhibited • 26) Pressure control of reagent dosing system inhibited --> dosing system goes into error state • 27) Plausibilty Check (-Drift) of DEF pressure sensor inhibited • 28) FId / High pressure test inhibited • 29) FId / Offset test of Rail pressure sensor disabled • 30) FId / Offset test of Rail pressure sensor only released, if this failure path is tested • 31) FId / Rail Pressure set point test inhibited • 32) FId / Function Identifier to determine, when the sensed value is to be replaced with a default when the signal source is ADC FId_RplValAbsUPmpP • 33) FId / Release of the SCRMon function/no emergency shut-off with emptying • 34) FId / Monitoring of DEF pressure inhibited (sensor supply error) • 35) FId / VGT Position is frozen to last valid value

https://truckmanualshub.com/

System reaction		• 36) FId / PI controller of VGT position bypassed and only Pre Control map used (open loop control) • 37) FId / Offset learning of VGT position sensor at Afterrun disabled • 38) FId / VGT Position is set to default value (TrbCh_TransStg.Dfl_C) • 39) FId / Electric signal range check for VGT position sensor disabled • 40) FId / Inhibit temperature plausibility check • 41) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 42) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 43) FId / Inhibit Charged Air Cooler monitoring • 44) FId / Inhibit OxiCat passive monitor • 45) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 46) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 47) FId / Inhibit DPF efficiency monitor • 48) FId / Interrupt DPF efficiency monitor • 49) FId / Inhibit monitor for DPF frequent regeneration • 50) FId / Inhibit monitor for incomplete regeneration of the DPF • 51) FId / Inhibit EGR cooler efficiency monitoring • 52) FId / Inhibit reverting valve plausibility check • 53) FId / Inhibit Physical Range Check of Pump Module Pressure Sensor
Failure cause		• Excessive battery voltage, defect in wiring harness, electrical failure in connected sensors or in the ECM
Failure repair		• Check battery voltage, check wiring for correct voltage supply of the connected sensor and the ECM. • Replace ECM
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with B38 (Position sensor Turbocharger) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B35 (Position sensor Cylinder) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B30 (DEF pressure sensor) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B17 (Position sensor Accelerator pedal) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B58 (Blow-by gas pressure sensor 1) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed

3598-12: ECU power stage2: Supply for sensors: Accelerator pedal2, Boost pressure, Fuel pressure, AC pressure

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • The sensor supply voltage is monitored by an HW comparator. If the sensor supply voltage lies outside of the switching thresholds, a fault is output. The detection thresholds are defined by the hardware and cannot be calibrated.
	[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing	• The supply voltage lies within the thresholds.

https://truckmanualshub.com/

System reaction	• None except FIDs
	• 1) FId / Limited engine speed because of accelerator pedal error • 2) FId / Increased engine speed because of accelerator pedal error • 3) FId / AC compressor shut off to protect AC compressor and Engine cooling system • 4) FId / Replacement value for AC pressure signal • 5) FId / Check of gain plausibility of air flow meter (HFM/AFS) at low idle disabled • 6) FId / Freeze last valid value of compressor coolant pressure in case of preliminary failure detected • 7) FId / Set replacement value for AC coolant pressure when failure is validated • 8) FId / EGR switched off • 9) FId / Final defect of acceleration pedal signal 2 detected --> APP2 Signal not useable • 10) FId / Provisional defect of acceleration pedal signal 2 detected - APP2 Signal frozen until final defect or healing detected • 11) FId / Electr Signal range check SRC for Accelerator Pedal 2 APP2 disabled • 12) FId / Preceding provisional errors in the signal chain of acceleration pedal signal 2 detected • 13) FId / SRC high on APP2 detected --> APP2 Signal not useable • 14) FId / Accelerator Pedal 2 (APP2) frozen during active NTP (no-load test pulse) monitoring • 15) FId / Synchronisation check of acceleration pedal disabled • 16) FId / Deactivates NOx monitoring • 17) FId / Reciprocal lambda signal replaced by substitute value for modelling • 18) FId / Inhibit EGR cooler efficiency monitoring • 19) FId / Replacement value for temperature downstream Turbocharger used for modelling • 20) Fid / Correction due to engine operating mode transitions inhibited • 21) FId / Fix substitution value (FEh) of Boost Pressure transmit to CAN Message INCON (Inlet/Exhaust condition) • 22) Fid / Fix substitution value (FEh) of Boost pressure transmit to CAN Message INCON (Inlet/Exhaust condition) • 23) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 24) FId / Status of function identifier FId_EngDemTrqLimErr1 • 25) FId / Torque limitation 2 activated for power reduction • 26) FId / Engine overheat protection active • 27) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 28) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 29) FId / Freeze abs.DEF pressure value if preliminary failure detected • 30) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 31) FId / Single Injector shut off test inhibited • 32) FId / Analysis of engine starting problem disabled • 33) FId / Injector preparation before first energising disabled • 34) FId / Run Up test inhibited • 35) FId / The Adaptation of lambda Sensor disabled • 36) FId / The Difference Check between several Lambda Sensors is disabled • 37) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 38) FId / Electrical Open Load Check of Lambda Sensor disabled • 39) FId / O2 Signal of Lambda Sensor not valid • 40) FId / Signal Range Check of O2 Signal of lambda Sensor disabled • 41) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 42) FId / Set point test of Metering Unit (MeUn) of Common Rail disabled • 43) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 44) Fid / The actual Boost pressure is corrected by a fix value (Air_pPCRDflPCACDs_C) instead by the actual boost temperature for the Boost pressure control • 45) FId / CLosed Loop Boost pressure governor shut off due to a System error

https://truckmanualshub.com/

System reaction		• 46) FId / Fuel rail pressure control valve (PCV) set point test inhibited • 47) FId / Particulate filter ((DPF) Regeneration inhibited • 48) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 49) FId / Inhibit plausibility test of the Intake Valve upstream air pressure sensor • 50) FId / Freeze Intake Valve upstream air pressure value at preliminary failure detection • 51) FId / Replace Intake Valve upstream air pressure value with fix value • 52) FId / PTO Accelerator pedal position frozen to last valid value during debouncing of preliminary failure • 53) FId / PTO Accelerator pedal position set to fix value in case of final defect • 54) FId / PTO Engine speed adjustment resistor voltage set to a fix replacement value • 55) Plausibilty Check (-Drift) of DEF pressure sensor inhibited • 56) FId / Pressure wave correction of cylinder specific fuel quantity (QWC) disabled • 57) FId / Closed loop Control of Fuel Rail pressure disabled (open loop control by pre control map for MeUn and PCV) • 58) FId / High pressure test inhibited • 59) FId / Offset test of Rail pressure sensor disabled • 60) FId / Offset test of Rail pressure sensor only released, if this failure path is tested • 61) FId / Stop reading railpressure sensor values and set an default sensor pressure value / disable electric monitoring of rail pressure sensor • 62) FId / Default Rail Pressure value instead of measured pressure used • 63) FId / Accepted range of Fuel Rail pressure set point by fix min and max value instead of engine speed and load dependant limits • 64) FId / Rail Pressure set point test inhibited • 65) FId / Function Identifier to determine, when the sensed value is to be replaced with a default when the signal source is ADC FId_RplValAbsUPmpP • 66) FId / Inhibit SRC and signal acquisition of Air Pressure Upstream Intake Valve signal • 67) FId / Monitoring of DEF pressure inhibited (sensor supply error) • 68) FId / Inhibit temperature plausibility check • 69) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 70) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 71) FId / Inhibit Charged Air Cooler monitoring • 72) FId / Misfire Detection disabled • 73) FId / Inhibit OxiCat passive monitor • 74) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 75) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 76) FId / Inhibit DPF efficiency monitor • 77) FId / Interrupt DPF efficiency monitor • 78) FId / Inhibit monitor for DPF frequent regeneration • 79) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Excessive battery voltage, defect in wiring harness, electrical failure in connected sensors or in the ECM
Failure repair		• Check battery voltage, check wiring for correct voltage supply of the connected sensor and the ECM. • Replace ECM
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with B19 (Pressure and temperature sensor Turbocharger) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B51 (Rail pressure sensor) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B17 (Position sensor Accelerator pedal) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B33 (PTO load sensor) is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed

3599-12: ECU power stage3: Supply for sensors: DPF differential pressure, Oil pressure, EGR valve position, Air humidity sensor

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • The sensor supply voltage is monitored by an HW comparator. If the sensor supply voltage lies outside of the switching thresholds, a fault is output. The detection thresholds are defined by the hardware and cannot be calibrated.
	[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing	• The supply voltage lies within the thresholds.

https://truckmanualshub.com/

		• None except FIDs
System reaction		• 1) FId / EGR switched off • 2) FId / Deactivates NOx monitoring • 3) FId / Inhibit Oil pressure measurement • 4) FId / Oil pressure sensor defective • 5) FId / DPF differential pressure defective • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 7) FId / Last valid value for EGR Valve position is frozen • 8) FId / EGR Valve offset learning inhibited • 9) FId / Fixed replacement value for EGR Valve position is used if failure validated • 10) FId / Power stage monitoring for EGR Valve inhibited • 11) FId / inhibited in case of Temporary defect associated with sensor, when the sensed value is from Hardware • 12) FId / inhibited in case of Permanent defect associated with sensor, when the sensed value is from Hardware • 13) FId / Freeze last valid value for oil pressure if preliminary failure is detected • 14) FId / Plausibility check oil pressure sensor inhibited • 15) FId / Replace oil pressure value if failure is validated • 16) FId / Oil pressure sensor supply error active • 17) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 18) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 19) FId / Particulate filter ((DPF) Regeneration inhibited • 20) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 21) FId / Inhibit dynamic check of differential pressure across particle filter • 22) FId / Inhibit enhanced SRC for particle filter differential pressure • 23) FId / Trigger substitute function for PPFltDiff output in case of temporary SRC errors in particle-filter differential pressure. • 24) FId / Inhibit plausibility check for DPF differential pressure • 25) FId / Trigger substitute function for PPFltDiff output in case of permanent SRC errors in particle-filter differential pressure sensor. • 26) FId / Signal range check monitoring for air humidity inhibited, sensor supply error • 27) FId / Inhibit Charged Air Cooler monitoring • 28) FId / Inhibit OxiCat passive monitor • 29) FId / Inhibit DPF efficiency monitor • 30) FId / Interrupt DPF efficiency monitor • 31) FId / Inhibit monitor for DPF frequent regeneration • 32) FId / Inhibit monitor for incomplete regeneration of the DPF • 33) FId / Inhibit EGR cooler efficiency monitoring • 34) FId / Status of function identifier FId_EngDemTrqLimErr5 • 35) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Excessive battery voltage, defect in wiring harness, electrical failure in connected sensors or in the ECM
Failure repair		• Check battery voltage, check wiring for correct voltage supply of the connected sensor and the ECM. • Replace ECM
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A14 (EGR valve) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B27 (Humidity and temperature sensor “Intake air”) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B37 (DPF differential pressure sensor) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with S11 (Oil pressure switch) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B59 (Blow-by gas pressure sensor 2) is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed

3659-0: Corrected value of voltage for opening the injector 1 is out of valid range.

Generation condition		[Test Condition] • Continuous
		[Fault Detection] • Opening voltage corrected by learned factor (NVC) and temperature compensation is out of fuel pressure dependant range.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing		• Opening voltage corrected by learned factor (NVC) and temperature compensation is within fuel pressure dependant range.
System reaction		• Possibly irregular engine running due to non equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied) • Further reaction according FID (see FID's)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 3) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 4) FId / Misfire Detection disabled • 5) FId / Inhibit OxiCat passive monitor • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors • ECU internal defect (Injector power stage / Booster)
Failure repair		• Check wiring • Check injectors, replace them if necessary • Replace ECU
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "Y15 (Fuel injector 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Perform coding of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3659-6: The fuel injector (cylinder 1) has a short circuit to ground.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • If the measured pattern for the injector evaluation of cylinder 1 is equal to applied behaviour bit pattern for general short circuit error detection.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None except FIDs.
	• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 3) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 4) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 5) FId / Cylinder 1 (firing order) shut off • 6) FId / Nominal Voltage Calibration NVC of injectors disabled • 7) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 8) FId / Redundant Engine shut off path not tested due to error of an injector • 9) FId / Redundant Engine shut off path test inhibited • 10) FId / Particulate filter ((DPF) Regeneration inhibited • 11) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 15) FId / Misfire Detection disabled • 16) FId / Inhibit OxiCat passive monitor
Failure cause	• Short circuit in wiring or injector
Failure repair	• Check wiring, replace fuel injector of cylinder 1.

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y15 (Fuel injector 1)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Perform coding of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

3659-15: Discharge time of injector 1 is out of valid range.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Discharge time difference to the nominal value >= 60.00us
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing	• Discharge time difference to the nominal value < 60.00us

https://truckmanualshub.com/

		• Possibly irregular engine running due to non equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied) • Only according FID (see FID's)
System reaction		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 3) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 4) FId / Misfire Detection disabled • 5) FId / Inhibit OxiCat passive monitor • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors • ECU internal defect (Injector power stage / Booster)
Failure repair		• Check wiring • Check injectors, replace them if necessary • Replace ECU
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y18 (Fuel injector 4). If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y18 (Fuel injector 4)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Perform coding of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3661-6: The fuel injector (cylinder 4) has a short circuit to ground.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • If the measured pattern for the injector evaluation of cylinder 4 is equal to applied behaviour bit pattern for general short circuit error detection.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

		• None except FIDs.
System reaction		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Fuel quantity Balancing Control disabled (e.g. error in crankshaft speed signal) • 3) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 4) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 5) FId / Cylinder 3 (firing order) shut off • 6) FId / Nominal Voltage Calibration NVC of injectors disabled • 7) FId / Redundant Engine shut off path not tested due to error debouncing of an injector • 8) FId / Redundant Engine shut off path not tested due to error of an injector • 9) FId / Redundant Engine shut off path test inhibited • 10) FId / Particulate filter ((DPF) Regeneration inhibited • 11) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 12) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 13) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 14) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 15) FId / Misfire Detection disabled • 16) FId / Inhibit OxiCat passive monitor
Failure cause		• Short circuit in wiring or injector
Failure repair		• Check wiring, replace fuel injector of cylinder 4.
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y18 (Fuel injector 4). If corresponding fault codes are also present on other components, check the common power supply and common ground point “ for open circuit and short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y18 (Fuel injector 4)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Perform coding of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

3661-15: Discharge time of injector 4 is out of valid range.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Discharge time difference to the nominal value >= 60.00us
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing		• Discharge time difference to the nominal value < 60.00us
System reaction		• Possibly irregular engine running due to non equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied) • Only according FID (see FID's)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 3) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 4) FId / Misfire Detection disabled • 5) FId / Inhibit OxiCat passive monitor • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors • ECU internal defect (Injector power stage / Booster)
Failure repair		• Check wiring • Check injectors, replace them if necessary • Replace ECU
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y18 (Fuel injector 4). If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "Y18 (Fuel injector 4)". Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Perform coding of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3661-16: The voltage for opening the injector 4 is out of valid range.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Difference of the actual voltage from the required one >= 20.00V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing		• Difference of the actual voltage from the required one < 20.00V
System reaction		• Possibly irregular engine running due to non equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied) • Further reaction according FID (see FID's)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 3) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 4) FId / Misfire Detection disabled • 5) FId / Inhibit OxiCat passive monitor • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors • ECU internal defect (Injector power stage / Booster)
Failure repair		• Check wiring • Check injectors, replace them if necessary • Replace ECU
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y18 (Fuel injector 4). If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y18 (Fuel injector 4)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Perform coding of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3662-0: Corrected value of voltage for opening the injector 2 is out of valid range.

Generation condition	[Test Condition] • Continuous
	[Fault Detection] • Opening voltage corrected by learned factor (NVC) and temperature compensation is out of fuel pressure dependant range.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing	• Opening voltage corrected by learned factor (NVC) and temperature compensation is within fuel pressure dependant range.
System reaction	• Possibly irregular engine running due to non equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied) • Further reaction according FID (see FID’s)
	• 1) FId / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 3) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 4) FId / Misfire Detection disabled • 5) FId / Inhibit OxiCat passive monitor • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause	• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors • ECU internal defect (Injector power stage / Booster)
Failure repair	• Check wiring • Check injectors, replace them if necessary • Replace ECU

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y16 (Fuel injector 2). If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y16 (Fuel injector 2)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y16 (Fuel injector 2) which A4 (Combustion engine Control unit) learns. Perform coding of Y16 (Fuel injector 2) which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3662-6: The fuel injector (cylinder 2) has a short circuit to ground.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • If the measured pattern for the injector evaluation of cylinder 2 is equal to applied behaviour bit pattern for general short circuit error detection.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events

3696-2: The signal value of component ‘DPF emergency regeneration switch’ is implausible.Data erratic, intermittent or incorrect

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Terminal 15 is ON AND • Emergency regeneration switch is pressed AND • switch plausibility not inhibited (error detected in T15 or vehicle speed monitoring) AND • vehicle speed > 2km/h {1.2mph}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 60.00s • Failure is detected if active for 50% of the time
Fault healing	• switch detected as plausible
System reaction	• None
Failure cause	• Emergency regeneration switch pressed at high vehicle speed or switch defective
Failure repair	• Check emergency regeneration switch

https://truckmanualshub.com/

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

3701-2: Signal Range Check (SRC) for 'Flow resistance of diesel particulate filter' reports HIGH.

Generation condition	[Test Condition] • The check is carried out continuously.
	[Fault Detection] • Pressure drop over filter higher than a exhaust flow dependant limit (from 6kPa {0.9psi, 0.06kgf/cm^2} at 0.00m^3/h over 40.2kPa {5.8psi, 0.4kgf/cm^2} at 800.00m^3/h to 105.1kPa {15psi, 1.1kgf/cm^2} at 2000.00m^3/h).
	[Defect Debouncing] • Defect condition fulfilled continuously >15000.0 ms
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

System reaction		• None (only via inhibit handler)
		• 1) FId / Status of function identifier FId_EngDemTrqLimErr1 • 2) FId / Torque limitation 2 activated for power reduction • 3) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 4) FId / Pressure Compensation of O2-Signal can not be learnt - is taken from the curve (LSU_facPresComLean_CUR) • 5) FId / Inhibit DPF monitor • 6) FId / Substitute calibration array is used to determinate the regeneration lock-out time of particulate filter (DPF)
Failure cause		• DPF is clogged. • Filter regeneration was not successful or not possible.
Failure repair		• Launch service regeneration via tester and check filter and exhaust system.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3702-2: Regeneration of the diesel particulate filter was aborted.

Generation condition	[Test Condition] • The exhaust-gas volume flow ASMod_dvolPFltEG > 300.00m^3/h. • The temperature of DPF ASMod_tPFltSurfSim < 399.96°C {751.93°F}. • For DPF load detection, the calculation from the differential pressure is active, and not the simulation (PFltLd_stSimOn). • Successful regeneration has been completed, driving distance since regeneration < 15.00km
	[Fault Detection] • Error counter is incriminated if the measured soot mass PFlt_mSotMeasNoCompl_mp > PFlt_mSotNoComplMax_mp stored in the curve • PFlt_mSotNoComplMax depending on the continuously simulated soot mass PFlt_mSotSimNoCompl_mp.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None except FIDs
	• 1) FId / Inhibit monitor for DPF frequent regeneration
Failure cause	• Real ash load too high or some restriction upstream OxiCat or differential pressure measuring wrong (rear hose clogged)
Failure repair	• Check exhaust for restrictions, check differential pressure sensor for gain failure, perform manual regeneration,

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any abnormalities are found on DPF differential pressure hose, recheck it closely and replace as necessary. Check DPF differential pressure hose for clogging, and remedy it if any restriction is found. Check for the correct connection of DPF differential pressure hose; if not correct, rectify the connection. If DPF differential pressure hose has been corrected or replaced, perform the learned value resetting procedure of B37 (DPF differential pressure sensor) learned by A4 (Combustion engine Control unit). Check Exhaust system for clogging, and remedy it if any restriction is found. If this diagnosis code has occurred again even after conducting DPF regeneration, clean or replace DPF. If DPF has been corrected or replaced, perform the learned value resetting procedure of DPF learned by A4 (Combustion engine Control unit). For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B37 (DPF differential pressure sensor). Check the circuit across B37.3/1 and A4.X2.94/22 for open or short circuit. Check the circuit across B37.3/3 and A4.X2.94/54 for open or short circuit. Check the circuit across B37.3/2 and A4.X2.94/18 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B37 (DPF differential pressure sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B37 (DPF differential pressure sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

https://truckmanualshub.com/

3719-16: The regeneration frequency of the diesel particulate filter is too high.

Generation condition		[Test Condition] • Monitor not inhibited by another failure (FId_PFltFreq is not set) • Soot mass value PFltLd_mSot is greater than the limiting value for monitoring PFlt_mSotSimTotRgnFreq_mp • after a successful regeneration or an interrupted. • The soot mass limiting value PFlt_mSotThresRgnFreq_mp for monitoring for too frequent particulate filter regeneration depends on the emissions (NMHC, CO, NOx) during DPF regeneration (Ki factors) and ash volume PFltLd_volAsh.
		[Fault Detection] • Soot mass value from the particulate filter load calculation PFltLd_mSot > limiting value for monitoring PFlt_mSotSimTotRgnFreq_mp
		[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None except FIDs
		• 1) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Leakage of injectors (high soot) • Too low air flow (leakage in intake air system) • or differential pressure not measure correctly (rear hose line clogged). • Modelled soot not calculated correctly (EGR, air flow mass, DPF upstream temperature)
Failure repair		• Check differential pressure, check other sensor involved in soot modelling (if DTC is present) • Check leakage in intake system, check injectors • Perform service regeneration if needed
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3726-16: DPF model regeneration request too high

Generation condition		[Test Condition] • The check is carried out continuously.
		[Fault Detection] • If the regeneration mode request number > 4.00- i.e. collected soot mass > 65.00g
		[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing		• If the regeneration mode request number < 4.00-
System reaction		• Only by FID (see FID's)
		• 1) FId / Status of function identifier FId_EngDemTrqLimErr1 • 2) FId / Torque limitation 2 activated for power reduction • 3) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 4) FId / Inhibit DPF monitor
Failure cause		• Special ambient conditions and vehicle use which does not allow correct DPF regeneration due to too low exhaust temperatures • Temperature sensor before Oxicat and/or before DPF shows too low temperature • Oxicat does not work correctly (bad HC burning) - in this case also a further dedicated failure should be stored and the vehicle shows blue smoke and strong odour.
Failure repair		• Service regeneration should be performed to reduce soot mass in the filter • If Service regeneration fails: see troubleshooting there.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

3727-0: DPF model - number of maximum regenerations too high

Generation condition		[Test Condition] • A DPF regeneration requested.
		[Fault Detection] • Number of locked regenerations > 2.00-
		[Defect Debouncing] • Immediate
Fault healing		• If the requested regeneration mode < 1.00-, i.e. the regeneration is at least partially successful, the counter for locked regeneration is set to 0 and failure healed.
System reaction		• Probably high fuel consumption due to long time of regeneration (post injection active!) • Oil exchange request (due to Oil dilution) can be activated earlier due to long time post injection. • DPF can be overloaded due to “failed” regeneration --> possibly damaged at real regeneration. • Further reactions according FID (see FID’s)
		• 1) FId / Status of function identifier FId_EngDemTrqLimErr1 • 2) FId / Torque limitation 2 activated for power reduction • 3) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Special ambient conditions or vehicle use (city cycle) which lead to too low DPF temperature for real regeneration. • Temperature sensor before Oxicat or before DPF show too low temperature, so system dose not detect real regeneration. • Oxicat does not work correctly, i.e. the temperature increase is too low (should be shown by a additionally stored dedicated failure)
Failure repair		• Check temperature sensor before Oxicat and before DPF for correct measuring • Check Oxicat • Check DPF
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

4009-3: Component ‘Fuel filter heater’ has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state and 2.00s after last CAN controller is no more in bus-off state • Monitoring only active if power stage actuated, i.e. filter heating active, i.e. Fuel temp < -3.04°C {26.53°F} (switch off at > 4.96°C {40.93°F}) AND engine NOT cranking AND engine speed > 5.00rpm • Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
	[Fault Detection] • The power stage hardware reports a “short circuit to battery” (SCB) error.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage each 1000.00ms 5.00- times in actual driving cycle. Failure healed, if the power stage does not report a “short to battery” (SCB) error. Else no healing possible at this driving cycle.
System reaction	• Power stage is shut-off, i.e no fuel heating possible.
Failure cause	• Short circuit of wiring to external source or inside fuel filter heater
Failure repair	• Check of wiring, replace fuel filter heater

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K30 (Fuel heater relay). Remove the connector of A20 (SAM). Check the circuit across A20.X2.14/4 and K30.5/3 for open or short circuit. Check the circuit across A4.X2.94/90 and K30.5/1 for open or short circuit. Check the circuit across K30.5/5 and A20.X1.18/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “K30 (Fuel heater relay)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspect or verify the following items. Repair or replace faulty items as necessary. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X43 (Intermediate connector). Check the circuit across A4.X2.94/90 and X43.2/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across K30 (Fuel heater relay) and X43 (Intermediate connector). Repair or replace the harness across K30 (Fuel heater relay) and A20 (SAM). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X43 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3

4009-4: Component 'Fuel filter heater' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state and 2.00s after last CAN controller is no more in bus-off state • Monitoring only active if power stage NOT actuated, i.e. filter heating NOT active, i.e. Fuel temp > 4.96°C {40.93°F} or engine cranking or engine speed < 5.00rpm • Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
		[Fault Detection] • The power stage hardware reports a "short circuit to ground" (SCG) error.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1000.00ms 5.00- times in actual driving cycle. Failure healed, if the power stage does not report an "short to ground" (SCG) error. Else no healing possible at this driving cycle.
System reaction		• Power stage is shut-off, i.e no fuel heating possible.
Failure cause		• Short circuit of wiring to ground or inside fuel filter heater
Failure repair		• Check of wiring, replace fuel filter heater
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K30 (Fuel heater relay). Remove the connector of A20 (SAM). Check the circuit across A20.X2.14/4 and K30.5/3 for open or short circuit. Check the circuit across A4.X2.94/90 and K30.5/1 for open or short circuit. Check the circuit across K30.5/5 and A20.X1.18/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “K30 (Fuel heater relay)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspect or verify the following items. Repair or replace faulty items as necessary. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X43 (Intermediate connector). Check the circuit across A4.X2.94/90 and X43.2/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across K30 (Fuel heater relay) and X43 (Intermediate connector). Repair or replace the harness across K30 (Fuel heater relay) and A20 (SAM). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X43 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3

https://truckmanualshub.com/

4009-5: Component Fuel filter heater has a no load error.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state and 2.00s after last CAN controller is no more in bus-off state • Monitoring only active if power stage NOT actuated, i.e. filter heating NOT active, i.e. Fuel temp > 4.96°C {40.93°F} or engine cranking or engine speed < 5.00rpm • Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
		[Fault Detection] • The power stage hardware reports a “no load” (OL) error.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1000.00ms 5.00- times in actual driving cycle. Failure healed, if the power stage does not report an “open load” (OL) error. Else no healing possible at this driving cycle.
System reaction		• Power stage is shut-off, i.e no fuel heating possible.
Failure cause		• Broken or disconnected wiring or defective fuel filter heater.
Failure repair		• Check of wiring or replace fuel filter heater
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K30 (Fuel heater relay). Remove the connector of A20 (SAM). Check the circuit across A20.X2.14/4 and K30.5/3 for open or short circuit. Check the circuit across A4.X2.94/90 and K30.5/1 for open or short circuit. Check the circuit across K30.5/5 and A20.X1.18/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “K30 (Fuel heater relay)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspect or verify the following items. Repair or replace faulty items as necessary. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X43 (Intermediate connector). Check the circuit across A4.X2.94/90 and X43.2/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across K30 (Fuel heater relay) and X43 (Intermediate connector). Repair or replace the harness across K30 (Fuel heater relay) and A20 (SAM). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X43 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3

4009-12: Component 'Fuel filter heater' signals overtemperature.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state and 2.00s after last CAN controller is no more in bus-off state • Monitoring only active if power stage actuated, i.e. filter heating active, i.e. Fuel temp < -3.04°C {26.53°F} (switch off at > 4.96°C {40.93°F}) AND engine NOT cranking AND engine speed > 5.00rpm • Battery voltage > 9.50V (switch off < 9.00V) and Test of redundant shut-off paths not active)
		[Fault Detection] • Hardware reports an over temperature error (OT) on the power stage for the Fuel Filter heater.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 510.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1.00s 5.00- times in actual driving cycle. Failure healed, if the power stage does not report an "short to ground" (SCG) error. Else no healing possible at this driving cycle.
System reaction		• Power stage is shut-off (Exhaust Flap in open position).
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• Check load and output, check wiring, replace ECU
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of K30 (Fuel heater relay). Remove the connector of A20 (SAM). Check the circuit across A20.X2.14/4 and K30.5/3 for open or short circuit. Check the circuit across A4.X2.94/90 and K30.5/1 for open or short circuit. Check the circuit across K30.5/5 and A20.X1.18/5 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “K30 (Fuel heater relay)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspect or verify the following items. Repair or replace faulty items as necessary. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X43 (Intermediate connector). Check the circuit across A4.X2.94/90 and X43.2/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Repair or replace the harness across K30 (Fuel heater relay) and X43 (Intermediate connector). Repair or replace the harness across K30 (Fuel heater relay) and A20 (SAM). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3
	Step10	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X43 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3

4094-2: DEF quality deviate from standard.Data erratic, intermittent or incorrect

Generation condition		[Test Condition] • DEF tank refill is detected (current level > older stored level)
		[Fault Detection] • To detect this failure following conditions must be fulfilled: • after 10.00min (running time with active injection) the difference between stored and actual factor value > -262144.00- • after 20.00min (running time with active injection) the difference between stored and actual factor value > -262144.00- • the FID (FId_SCRCtlUrQlActActv) is activated via a failure (e.g. NOx Level monitoring)
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• the failure with activates the FID (FId_SCRCtlUrQlActActv) is healed
System reaction		• None except FIDs
		• 1) FId / Function Identifier to trigger Moderate Warning level for Status Block 3
Failure cause		• DEF quality deviating from standard
Failure repair		• Check DEF quality in the tank
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520192-20: Air flow meter: AFS correction at low idle exceeds drift limitMaximum value

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • Continuously
	[Fault Detection] • The new learned correction factor is compared to the old one, its variation is limited at 0.03- • The calculated and limited correction factor at low-idle (AFS_facIdlAdjVal_mp) for the current driving cycle exceeds 0.16-
	[Defect Debouncing] • None
Fault healing	• No healing possible in the current driving cycle. • The new learned correction factor lies below the limit 0.16-
System reaction	• None (except Fids).
	• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 3) FId / Inhibit DPF monitor • 4) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 5) FId / Particulate filter ((DPF) Regeneration inhibited • 6) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 7) FId / Inhibit Charged Air Cooler monitoring
Failure cause	• Fouling or blockage of the air mass sensor, inaccurate sensor due to ageing, leakage or obstruction in the intake duct, jammed EGR actuator, defective VTG/WG
Failure repair	• Clean sensor and check intake system, replace air mass sensor if necessary, check EGR actuators and boost pressure actuator. • Reinitialize drift compensation values using UDS service Routine Control (Id $0242)

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If EGR system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with EGR system is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Turbocharger system is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If EGR system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

520192-21: Air flow meter: AFS correction at low idle exceeds drift limitMinimum value

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • Continuously
	[Fault Detection] • The new learned correction factor is compared to the old one, its variation is limited at 0.03- • The calculated and limited correction factor at low-idle (AFS_facIdlAdjVal_mp) for the current driving cycle is below -0.16-
	[Defect Debouncing] • None
Fault healing	• No healing possible in the current driving cycle. • The new learned correction factor lies above the limit -0.16-
System reaction	• None (except Fids).
	• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 3) FId / Inhibit DPF monitor • 4) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 5) FId / Particulate filter ((DPF) Regeneration inhibited • 6) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 7) FId / Inhibit Charged Air Cooler monitoring
Failure cause	• Fouling or blockage of the air mass sensor, inaccurate sensor due to ageing, leakage or obstruction in the intake duct, jammed EGR actuator, defective VTG/WG
Failure repair	• Clean sensor and check intake system, replace air mass sensor if necessary, check EGR actuators and boost pressure actuator • Reinitialize drift compensation values using UDS service Routine Control (Id $0242)

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If EGR system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with EGR system is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Turbocharger system is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If EGR system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

520193-20: Air flow meter: AFS correction at load point exceeds drift limitMaximum value

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • Continuously
	[Fault Detection] • If following release conditions: • vehicle speed between -1.00km/h and 150km/h {93.2mph} • induction pressure Air_pCACDs is between 100kPa {15psi, 1.0kgf/cm^2} and 3277kPa {475psi, 33kgf/cm^2} • Engine speed Epm_nEng and injection quantity InjCtl_qCurr are within the quantity/engine speed window applied via curves AFS_qWinLdAdjThresHi and AFS_qWinLdAdjThresLo. • driving point almost stationary • no drift compensation already carried out in current driving cycle • The new learned correction factor under load condition is compared to the old one, its variation is limited at 0.03- • The calculated and limited correction factor (AFS_facLdAdjVal_mp) for the current driving cycle exceeds 0.16-
	[Defect Debouncing] • None
Fault healing	• No healing possible in the current driving cycle. • The new learned correction factor lies below the limit 0.16-
System reaction	• None (except Fids).
	• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 3) FId / Inhibit DPF monitor • 4) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 5) FId / Particulate filter ((DPF) Regeneration inhibited • 6) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 7) FId / Inhibit Charged Air Cooler monitoring

https://truckmanualshub.com/

Failure cause		• Fouling or blockage of the air mass sensor, inaccurate sensor due to ageing, leakage or obstruction in the intake duct, jammed EGR actuator, defective VTG/WG
Failure repair		• Clean sensor and check intake system, replace air mass sensor if necessary, check EGR actuators and boost pressure actuator. • Reinitialize drift compensation values using UDS service Routine Control (Id $0242)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If EGR system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with EGR system is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Turbocharger system is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If EGR system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9

https://truckmanualshub.com/

Inspection procedure	Step9	Inspection completed
	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

520195-20: Air flow meter: Sensitivity drift error for HFM sensorHIGH

Generation condition	[Test Condition] • Monitoring is active while the engine isn't cranking, 2.00s after engine start-up and if the ECU is not in afterrun • Drift test not inhibited by FID_AFSActrTst by tester intervention or by FID_AFSPlSetyDrft due to another failure. • Operation not in high altitude, i.e ambient pressure > 80kPa {12psi, 0.8kgf/cm^2}. • Engine in normal operation since at least 6.00s. • Engine temperature between 68.46°C {155.23°F} and 111.96°C {233.53°F} • Engine in steady state, i.e. the Boost air temperature variation between -1000°C {-1768°F}/s and 1000°C {1832°F}/s • Fuel injection quantity < 100.00mg/hub and engine speed between 620.00rpm and 840.00rpm. • Boost pressure < 104kPa {15psi, 1.1kgf/cm^2} • If available EGR throttle valve open, i.e. between -10.00% and 105.00% resp. the exhaust break flap position between 98.00% and 105.00% longer than 2.00s. • If available, throttle for variable swirl control between -10.00% and 110.00%. • EGR valve closed, i.e. between 105.00% and 98.00% since at least 2.00s: this is normally only the case during drift compensation learning at idle or at high engine speed, each once per driving cycle! Drift compensation is released and EGR valve closed for 13.00s (idle) resp. for 1.70s (high load), if all following conditions are met in addition to the above mentioned conditions for at least 1000.00ms: • Boost air temperature between -3549.94°C {-6357.89°F} and 3003.56°C {5438.41°F}. • Ambient temperature between -0.04°C {31.93°F} and 39.96°C {103.93°F}. • The engine is running in normal state since at least 14.00min. • Drift compensation not inhibited by FID_AFSAdjRls due to another failure • ambient pressure > 81kPa {12psi, 0.8kgf/cm^2} • And for correction at idle: • Difference between boost pressure and ambient pressure <3277kPa {475psi, 33kgf/cm^2} (i.e no boost pressure) • Injection quantity between 2.50mg/hub and 25.00mg/hub. • Engine speed between 600.00rpm and 850.00rpm. • no drift correction at idle executed this driving cycle. And for correction at High Load: • Vehicle speed between -1.00km/h and 150km/h {93.2mph} • Boost pressure between 100kPa {15psi, 1.0kgf/cm^2} and 3277kPa {475psi, 33kgf/cm^2}. • Fuel injection quantity between engine speed dependant limits: • between 100.00mg/hub at 2250.00rpm and 100.00mg/hub at 2250.00rpm • between 55.00mg/hub at 2900.00rpm and 100.00mg/hub at 2750.00rpm • between 47.07mg/hub at 3500.00rpm and 72.00mg/hub at 3500.00rpm • between 0.00mg/hub at 4000.00rpm and 0.00mg/hub at 4000.00rpm • Engine steady state, i.e. variation of boost pressure (filtered by 500.00ms)< 49.997kPa {7.2psi, 0.5kgf/cm^2}/s, of fuel injection (filtered by 2.00s) < 4.00(mg/stroke)/s and engine speed (filtered by 999.99ms) < 180.00rpm/s • No drift compensation under load executed this driving cycle.
	[Fault Detection] • The ratio (filtered by 299.99ms) of measured air mass flow divided by modelled air mass flow > value from engine temperature dependent curve, i.e. the measured air flow is too high
	[Defect Debouncing] • Debounce time engine temperature dependent
Fault healing	• The ratio (filtered by 299.99ms) of measured air mass flow divided by modelled air mass flow < value from engine temperature dependent curve, i.e. the measured air flow is in range

https://truckmanualshub.com/

		• No substitute function is active during defect debouncing. After the defect debouncing time has elapsed, switchover to the modelled replace value ASMod_dmIndAirRef or, if the model cannot be used because of another failure (FId_AFSSysErr present) a replacement value from a map depending on engine speed and pressure in the induction volume is used.
System reaction		• 1) FId / Air mass flow calculated by gas equation (boost pressure, boost temperature, engine speed) instead of measuring by air flow meter (HFM/AFS) • 2) FId / EGR switched off • 3) FId / Inhibit ISS, max number of engine starts exceeded • 4) FId / Deactivates NOx monitoring • 5) FId / Replacement value for OxiCat temperature downstream used for modelling • 6) FId / Particulate filter ((DPF) Regeneration inhibited • 7) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 8) FId / Dynamic soot mass flow correction for particulate filter (DPF) inhibited • 9) FId / Reciprocal lambda signal replaced by substitute value for modelling • 10) FId / Dew Point detection for Lambda Sensor (LSU) not possible - LSU Heater switched on after a fix time • 11) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 12) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 13) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 14) FId / The Adaptation of lambda Sensor disabled • 15) FId / The Difference Check between several Lambda Sensors is disabled • 16) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 17) FId / Electrical Open Load Check of Lambda Sensor disabled • 18) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 19) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 20) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 21) FId / Inhibit DPF monitor • 22) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 23) FId / Substitute calibration array is used to determinate the regeneration lock-out time of particulate filter (DPF) • 24) FId / Substitute parameter set of maximum values is used for the calculation of fuel consumption, operating hours and distance covered since the last successful regeneration of particulate filter (DPF) • 25) FId / Soot mass calculation of particulate filter (DPF) deactivated, only simulation is used. • 26) FId / Friction torque due to particulate filter (DPF) flow resistance set to • 27) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 28) FId / Status of function identifier FId_EngDemTrqLimErr5 • 29) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Defect in wiring, inaccurate or defective air mass sensor, leakage or obstruction in the intake duct, defective VTG/WG
Failure repair		• Check wiring of the intake air mass sensor and its accuracy and replace it if necessary, check intake duct and boost pressure actuator. • Reset HFM learning drift correction factors using UDS service Routine Control (Id $0242)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual.

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed
	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12

https://truckmanualshub.com/

Inspection procedure	Step11	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

And for correction at High Load: • Vehicle speed between -1.00km/h and 150km/h {93.2mph} • Boost pressure between 100kPa {15psi, 1.0kgf/cm^2} and 3277kPa {475psi, 33kgf/cm^2}. • Fuel injection quantity between engine speed dependant limits: • between 100.00mg/hub at 2250.00rpm and 100.00mg/hub at 2250.00rpm • between 55.00mg/hub at 2900.00rpm and 100.00mg/hub at 2750.00rpm • between 47.07mg/hub at 3500.00rpm and 72.00mg/hub at 3500.00rpm • between 0.00mg/hub at 4000.00rpm and 0.00mg/hub at 4000.00rpm • Engine steady state, i.e. variation of boost pressure (filtered by 500.00ms)< 49.997kPa {7.2psi, 0.5kgf/cm^2}/s, of fuel injection (filtered by 2.00s) < 4.00(mg/stroke)/s and engine speed (filtered by 999.99ms) < 180.00rpm/s • No drift compensation under load executed this driving cycle.
	[Fault Detection] • The ratio (filtered by 299.99ms) of measured air mass flow divided by modelled air mass flow < engine temperature dependent curve, i.e. the measured air flow is too low
	[Defect Debouncing] • Debounce time engine temperature dependent
Fault healing	• The ratio (filtered by 299.99ms) of measured air mass flow divided by modelled air mass flow > value from engine temperature dependent curve, i.e. the measured air flow is in range

https://truckmanualshub.com/

		• No substitute function is active during defect debouncing. After the defect debouncing time has elapsed, switchover to the modelled replace value ASMod_dmIndAirRef or, if the model cannot be used because of another failure (FId_AFSSysErr present) a replacement value from a map depending on engine speed and pressure in the induction volume is used.
System reaction		• 1) FId / Air mass flow calculated by gas equation (boost pressure, boost temperature, engine speed) instead of measuring by air flow meter (HFM/AFS) • 2) FId / EGR switched off • 3) FId / Inhibit ISS, max number of engine starts exceeded • 4) FId / Deactivates NOx monitoring • 5) FId / Replacement value for OxiCat temperature downstream used for modelling • 6) FId / Particulate filter ((DPF) Regeneration inhibited • 7) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 8) FId / Dynamic soot mass flow correction for particulate filter (DPF) inhibited • 9) FId / Reciprocal lambda signal replaced by substitute value for modelling • 10) FId / Dew Point detection for Lambda Sensor (LSU) not possible - LSU Heater switched on after a fix time • 11) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 12) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 13) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 14) FId / The Adaptation of lambda Sensor disabled • 15) FId / The Difference Check between several Lambda Sensors is disabled • 16) FId / Dynamic Signal Monitoring of Lambda Sensor disabled • 17) FId / Electrical Open Load Check of Lambda Sensor disabled • 18) FId / Plausibility Check of O2-Signal of Lambda Sensor (e.g. with HFM or Air calculation by Boost pressure) is disabled and last valid value taken • 19) FId / Correction of begin of Main injection 1 according deviation of air flow disabled • 20) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 21) FId / Inhibit DPF monitor • 22) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 23) FId / Substitute calibration array is used to determinate the regeneration lock-out time of particulate filter (DPF) • 24) FId / Substitute parameter set of maximum values is used for the calculation of fuel consumption, operating hours and distance covered since the last successful regeneration of particulate filter (DPF) • 25) FId / Soot mass calculation of particulate filter (DPF) deactivated, only simulation is used. • 26) FId / Friction torque due to particulate filter (DPF) flow resistance set to • 27) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 28) FId / Status of function identifier FId_EngDemTrqLimErr5 • 29) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause		• Defect in wiring, inaccurate or defective air mass sensor, leakage or obstruction in the intake duct, jammed EGR actuator, defective VTG/WG
Failure repair		• Check wiring of the intake air mass sensor and its accuracy and replace it if necessary, check intake duct, EGR actuators and boost pressure actuator. • Reset HFM learning drift correction factors using UDS service Routine Control (Id $0242)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual.

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B18 (Air flow and intake air temperature sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and B18.4/3 for open or short circuit. Check the circuit across A4.X1.60/38 and B18.4/4 for open or short circuit. Check the circuit across A4.X1.60/44 and B18.4/2 for open or short circuit. Check the circuit across A20.X10.14/2 and B18.4/1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B18 (Air flow and intake air temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B18 (Air flow and intake air temperature sensor) which A4 (Combustion engine Control unit) learns. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed
	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X1.60/42 and X39.12/4 for open or short circuit. Check the circuit across A4.X1.60/38 and X39.12/5 for open or short circuit. Check the circuit across A4.X1.60/44 and X39.12/6 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12

https://truckmanualshub.com/

Inspection procedure	Step11	Inspection procedure Repair or replace the harness across B18 (Air flow and intake air temperature sensor) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X39 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

520200-2: Faulty component 'Air conditioning' / Faulty component 'Air conditioning switch'

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • If A/C signal is not received via CAN.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• If A/C signal is received via CAN
System reaction		• AirC_stSwtPrsis set to the default value 0.00- A/C switch is set at value not present, all monitorings for Air conditioner are shut off • Further reaction see FIDs
		• 1) FId / Set replacement value for AC presence (not present)
Failure cause		• A/C defective, A/C supply defective
Failure repair		• Check A/C supply, check A/C module
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520200-12: Air conditioning: Plausibility error CAN input signals

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously.
	[Fault Detection] • If A/C signal received via CAN is not plausible (Com_stAC==2).
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing	• If A/C signal received via CAN is plausible (Com_stAC==1)

https://truckmanualshub.com/

System reaction		• A/C switch is set at value not present, all monitorings for Air conditioner are shut off • Further reaction see FIDs
		• 1) FId / Set replacement value for AC presence (not present)
Failure cause		• CAN Timeout in message Com_stAC, A/C supply defective, CAN connection problem
Failure repair		• Check presence and correct connection of the A/C, • check A/C voltage supply, check wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A7 (Air Conditioning electronic control unit & control panel) is generated, make a system diagnosis according to the diagnosis code. For procedures, refer to the Shop Manual. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step6
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520203-2: PassiveCAN bus error: NodeA

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
		[Fault Detection] • Bus Off at node A is detected
		[Defect Debouncing] • Defect condition fulfilled continuously > 40.0 ms
Fault healing		• To give the possibility for healing, controller is reinitialized every 50.00ms
System reaction		• None
Failure cause		• Wrong configuration of CAN timing (Prescaler, synchronization jump width, sampling, propagation and phase segments), bad termination resistors, defective network connection and contacts or defective CAN controller with erroneous messages.
Failure repair		• Check timing configuration with hardware compatibility, check termination resistors and network connection and contacts. Short circuits to external source, ground or CAN High to Low.Monitor CAN communication for erroneous behaviour of a participant.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520203-31: CAN fault: The configuration is faulty./The CAN controller is defective./The control unit has an internal hardware fault.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously.
	[Fault Detection] • Bus Off at node A is detected
	[Defect Debouncing] • Defect condition fulfilled continuously > 40.0 ms
Fault healing	• To give the possibility for healing, controller is reinitialized every 50.00ms
System reaction	• None except Fids
	• 1) FId / Release stand alone mode in monitoring
Failure cause	• Wrong configuration of CAN timing (Prescaler, synchronization jump width, sampling, propagation and phase segments), bad termination resistors, defective network connection and contacts or defective CAN controller with erroneous messages.
Failure repair	• Check timing configuration with hardware compatibility, check termination resistors and network connection and contacts. Short circuits to external source, ground or CAN High to Low.Monitor CAN communication for erroneous behaviour of a participant.

https://truckmanualshub.com/

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520207-2: Plausibility check of component 'Coolant temperature' The received data are implausible.

Generation condition		[Test Condition] • Initial measured temperatures are frozen and evaluated if: • Engine off time > 5.00h. • Plausibility test not inhibited by FId set
		[Fault Detection] • Temperature difference > 150.00K at 100.00s OR Temperature difference > 150.00K at 100.00s and < 150.00K at 100.00s but no heater is active (AddHtr_stDet = 0) failure is detected • Temperature differences limits are applied in curves depending on engine OFF time.
		[Defect Debouncing] • Immediate
Fault healing		• Temperature difference is in range
System reaction		• None except FIDs
		• 1) FId / Inhibit Charged Air Cooler monitoring • 2) FId / Misfire Detection disabled • 3) FId / Inhibit OxiCat passive monitor • 4) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 5) FId / Inhibit physical range check engine coolant temperature • 6) FId / Inhibit EGR cooler efficiency monitoring • 7) FId / Calculation of Turbocharger Compressor Temperature inhibited
Failure cause		• Coolant temperature sensor drifted
Failure repair		• Check sensor
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X1.60/55 and B39.2/1 for open circuit. Check electrical line between pins A4.X1.60/23 and B39.2/2 for open circuit. Check electrical line between pins A4.X1.60/55 and B39.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B39 (Coolant temperature sensor) for short-circuit to another line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component "B39 (Coolant temperature sensor)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step4
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

520208-12: ECU internal: SPI and COM errors

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Communication disturbances detected between processor and CJ945 Chip
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• No communication disturbance detected
System reaction		• None except FIDs
		• 1) FId / Substitution function for the Digital Input/Output module of ECU activated (due to Cj945 error)
Failure cause		• Electric disturbances, internal defect of the ECU leading to a SPI bus communication error
Failure repair		• Replace ECU if failure remains present
Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

520210-2: Combustion of cylinder: More than 1 not in equilibrium

Generation condition	[Test Condition] • Monitoring not inhibited by FID_CmbMon due to another failure • Fuel balancing not inhibited by FID_FBC due to another failure • Engine in normal running state since > 30.00s • Engine temperature > 49.96°C {121.93°F} • Fuel balancing active i.e.: • engine speed between -100.00rpm and 2500.00rpm and fuel quantity between • 2.00mg/hub and an engine speed dependant upper limit (50.00mg/hub at 800.00rpm)
	[Fault Detection] • The FBC integrator values of more than 1 cylinder are higher or lower than +/- 0.98- times the limitation quantity, which is dependant on the actual fuel quantity (from 0.00mg/hub at 1.50mg/hub over 0.50mg/hub at 2.00mg/hub and 5.00mg/hub at 7.50mg/hub to 6.00mg/hub at 60.00mg/hub) • OR • The FBC integrator value of 1 cylinder is higher or lower than +/- 0.98- times the limitation quantity, which is dependant on the actual fuel quantity (from 0.00mg/hub at 1.50mg/hub over 0.50mg/hub at 2.00mg/hub and 5.00mg/hub at 7.50mg/hub to 6.00mg/hub at 60.00mg/hub) AND the FBC integrator of at least one further cylinder is outside the tolerance of +/- 4.00mg/hub
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• The FBC integrator values for all cylinders incl cylinder 1 are within the normal range of +/- 4.00mg/hub • OR • only one cylinder is out of range, i.e. a failure CmbMonMin or CmbMonMax of a dedicated cylinder detected (see description of those failures)

https://truckmanualshub.com/

System reaction		• Possibly irregular idling or driving (specially at lower load range) • Only according FID (see FID's)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• non balanced cylinders possibly due to problem of one or more injectors.
Failure repair		• try to identify the irregular cylinders by the deviations at failure recognition (snap shot): the 2 extreme cylinders have probably a problem. • check regularity of combustion (idle test or run up test)
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). Remove the connector of Y16 (Fuel injector 2). Remove the connector of Y17 (Fuel injector 3). Remove the connector of Y18 (Fuel injector 4). Check the circuit across Y15.2/1 and A4.X1.60/31 for open or short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Check the circuit across Y16.2/1 and A4.X1.60/17 for open or short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Check the circuit across Y17.2/1 and A4.X1.60/16 for open or short circuit. Check the circuit across Y17.2/2 and A4.X1.60/1 for open or short circuit. Check the circuit across Y18.2/1 and A4.X1.60/32 for open or short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control "Fuel injector". Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

https://truckmanualshub.com/

520211-0: Combustion of cylinder1LOW

Generation condition		[Test Condition] • Monitoring not inhibited by FID_CmbMon due to another failure • Fuel balancing not inhibited by FID_FBC due to another failure • Engine in normal running state since > 30.00s • Engine temperature > 49.96°C {121.93°F} • Fuel balancing active i.e.: • engine speed between -100.00rpm and 2500.00rpm and fuel quantity between • 2.00mg/hub and an engine speed dependant upper limit (50.00mg/hub at 800.00rpm)
		[Fault Detection] • The FBC integrator values for all other cylinders are within the normal range of +/- 4.00mg/hub and the one for the cylinder no 1 (FBC_qDvtCyl[0]) higher than 0.98- times the limitation quantity, which is dependant on the actual fuel quantity (from 0.00mg/hub at 1.50mg/hub over 0.50mg/hub at 2.00mg/hub and 5.00mg/hub at 7.50mg/hub to 6.00mg/hub at 60.00mg/hub).
		[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing		• The FBC integrator values for all cylinders incl cylinder 1 are within the normal range of +/- 4.00mg/hub.
System reaction		• Possibly irregular idling or driving (specially at lower load range) • Only according FID (see FID's)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• injector of cylinder 1 has too low fuel quantity or the cylinder itself is defect (no compression/misfiring)
Failure repair		• check regularity of combustion (idle test or run up test) and replace injector if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "Y15 (Fuel injector 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed

520211-1: Combustion of cylinder1HIGH

Generation condition		[Test Condition] • Monitoring not inhibited by FID_CmbMon due to another failure • Fuel balancing not inhibited by FID_FBC due to another failure • Engine in normal running state since > 30.00s • Engine temperature > 49.96°C {121.93°F} • Fuel balancing active i.e.: • engine speed between -100.00rpm and 2500.00rpm and fuel quantity between • 2.00mg/hub and an engine speed dependant upper limit (50.00mg/hub at 800.00rpm)
		[Fault Detection] • The FBC integrator values for all other cylinders are within the normal range of +/- 4.00mg/hub and the one for the cylinder no 1 (FBC_qDvtCyl[0]) lower than -0.98- times the limitation quantity, which is dependant on the actual fuel quantity (from 0.00mg/hub at 1.50mg/hub over 0.50mg/hub at 2.00mg/hub and 5.00mg/hub at 7.50mg/hub to 6.00mg/hub at 60.00mg/hub).
		[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing		• The FBC integrator values for all cylinders incl cylinder 1 are within the normal range of +/- 4.00mg/hub.
System reaction		• Possibly irregular idling or driving (specially at lower load range) • Only according FID (see FID's)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• injector of cylinder 1 has too high fuel quantity (open locked injector)
Failure repair		• check regularity of combustion (idle test or run up test) and replace injector if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for run-up engine speed. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "Y15 (Fuel injector 1)". Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for run-up engine speed. For procedures, refer to the Shop Manual. Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed

520212-0: Combustion of cylinder3LOW

Generation condition		[Test Condition] • Monitoring not inhibited by FID_CmbMon due to another failure • Fuel balancing not inhibited by FID_FBC due to another failure • Engine in normal running state since > 30.00s • Engine temperature > 49.96°C {121.93°F} • Fuel balancing active i.e.: • engine speed between -100.00rpm and 2500.00rpm and fuel quantity between • 2.00mg/hub and an engine speed dependant upper limit (50.00mg/hub at 800.00rpm)
		[Fault Detection] • The FBC integrator values for all other cylinders are within the normal range of +/- 4.00mg/hub and the one for the cylinder no 3 (FBC_qDvtCyl[1]) higher than 0.98- times the limitation quantity, which is dependant on the actual fuel quantity (from 0.00mg/hub at 1.50mg/hub over 0.50mg/hub at 2.00mg/hub and 5.00mg/hub at 7.50mg/hub to 6.00mg/hub at 60.00mg/hub).
		[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing		• The FBC integrator values for all cylinders incl cylinder 3 are within the normal range of +/- 4.00mg/hub.
System reaction		• Possibly irregular idling or driving (specially at lower load range) • Only according FID (see FID's)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 3) FId / Inhibit ISS, max number of engine starts exceeded
Failure cause		• injector of cylinder 3 has too low fuel quantity or the cylinder itself is defect (no compression/misfiring)
Failure repair		• check regularity of combustion (idle test or run up test) and replace injector if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y17 (Fuel injector 3)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y17 (Fuel injector 3) which A14 (EGR valve) learns. Perform coding of Fuel injector which A14 (EGR valve) learns. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step6	Inspection procedure Perform the operation start and replace A14 (EGR valve). Go to Step7
	Step7	Inspection completed

520215-31: Torque limitation active-Cause: Turbo charger protection

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn’t running yet, while the engine isn’t cranking, 2.00s after engine startup and if the ECU is not in afterrun • Engine speed > 750.00rpm
		[Fault Detection] • A Power reduction > 130.00% or an engine speed limitation > 130.00% is asked by the VGT to protect it against overspeed at high altitude.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750.00rpm
System reaction		• None
Failure cause		• Active power reduction > 2.00s due to turbo charger protection
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

520216-31: Torque limitation active-Cause: engine protection

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • Engine Overheat protection not disabled by FID_EngPrtOvhtPrv due to another failure. • Engine speed > 750.00rpm
		[Fault Detection] • A Power reduction > 130.00% or an engine speed limitation > 130.00% is asked by the engine to protect it against overload depending on engine speed.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750.00rpm
System reaction		• None
Failure cause		• Active power reduction > 2.00s due to engine mechanics protection
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520217-31: Torque limitation active-Cause: Injection system

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • Engine speed > 750.00rpm
		[Fault Detection] • A Power reduction > 130.00% or an engine speed limitation > 130.00% is asked by High pressure fuel pump depending on engine speed and actual fuel pressure.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750.00rpm
System reaction		• None
Failure cause		• Active power reduction > 2.00s due to high pressure fuel pump protection
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

520218-31: Torque limitation active-Cause: Engine brake

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • Engine speed > 750.00rpm
		[Fault Detection] • A Power reduction > 130.00% or an engine speed limitation > 130.00% after engine brake release. • After engine brake release, the torque ramps up from 0 to desired torque with a slope of 2000000N·m {1475100lbs.ft, 203940kgf·m}/s. If the limited torque corrected by 2.5N·m {1.8lbs.ft, 0.25kgf·m} is lower than 130.00% of max torque, the failure is set.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750.00rpm
System reaction		• None
Failure cause		• Active power reduction > 2.00s due to torque rise limitation after engine brake release.
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520219-31: Torque limitation active-Cause: Diesel particulate filter

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • Engine speed > 750.00rpm
		[Fault Detection] • A Power reduction > 130.00% or an engine speed limitation > 130.00% due to particulate filter protection. • The particulate filter protection limits the calculated pressure drop over filter (= Flow resistance * Exhaust gas flow), which is depending on collected soot mass, by curve EngDem_trqLimPDiff.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750.00rpm
System reaction		• None
Failure cause		• Active power reduction > 5.00s due to torque limitation for pressure drop limitation over particulate filter.
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

520220-31: Information: Torque limitation by too high NOx emissions. Duration > 2 second.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • Engine speed > 750.00rpm
		[Fault Detection] • A Power reduction > 130.00% or an engine speed limitation > 130.00% due to OBD performance limitation. • The OBD performance limitation is activated it there is a failure active, which causes high NOx emissions for a certain time (24855.13d, 0.00s, 0.00s or 24855.13d depending on the failure). • The performance limiter is activated immediately within 5.00min or 5.00min (depending on limitation). • If the failure which caused the high NOx disappears, the performance limiter is released within 5.00s or 5.00s (depending on limitation) immediately.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750.00rpm
System reaction		• None
Failure cause		• Active power reduction due to the OBD performance limiter because of too high NOx emissions
Failure repair		• No actions necessary due to this failure alone. If powerreduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520221-31: Torque limitation active-Cause: SCRCAT protection

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • Engine speed > 750.00rpm
		[Fault Detection] • A Power reduction > 130.00% is asked by the SCR to protect it against too high temperature.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750.00rpm
System reaction		• None
Failure cause		• Active power reduction due to excessive temperatures in the SCR catalyst
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

https://truckmanualshub.com/

520222-31: Torque limitation active-Cause: Smoke limitation

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup and if the ECU is not in afterrun • Engine speed > 750.00rpm
		[Fault Detection] • A Power reduction > 130.00% or an engine speed limitation > 130.00% due to smoke limitation. • Depending on engine speed and actual air mass flow a minimal lambda is calculated by a map. The actual fuel mass is limited to this minimal allowed lambda. The limited fuel mass is calculated as maximum possible torque.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750.00rpm
System reaction		• None
Failure cause		• Active power reduction due to smoke limitation with unexpected long duration > 5.00s • If no other failure stored concerning EGR or Boost pressure control: • operation in extreme high altitude (>1800 m, i.e ambient pressure < 78kPa {11psi, 0.8kgf/cm^2}) • sticking of VGT or EGR actuator or engine brake flap (if available) • turbocharger with slow response (bad efficiency) • wrong signal of HFM (or boost pressure sensor if HFM not available)
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error. • If no failure stored in memory concerning EGR or Boost pressure control: • if failure occurred at high altitude > 1800m (ambient pressure < 78kPa {11psi, 0.8kgf/cm^2}): no action needed. • check actuators of EGR, Boost pressure and exhaust flap control for sticking. • Check turbocharger for correct efficiency • Check HFM and Boost pressure sensor for correct measuring values
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520225-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Timeout for transmit frame ComAmbCon is detected
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• Message is transmitted
System reaction	• None
Failure cause	• Defective CAN Controller within Chassis CAN, CAN Cables disconnected or broken. Short circuit in wiring.
Failure repair	• Check the installation and the proper connection of the Engine Control Unit to the CAN vehicle network. • Check correct operating conditions of the CAN controller. • Check the vehicle wirings.

https://truckmanualshub.com/

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520227-9: Error on transmission of CAN message (CAN message 'VIN' from control unit 'SAM')

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuous
		[Fault Detection] • Time out while receiving CAN Frame CGW_GVC9.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• As soon as the frame is received, the time out error is cleared.
System reaction		• When there is an error in the reception of the frame, then VIN counter signal will have previous valid value Vehicle Identification Number [0-16] will have previous valid value.
		• CAN bus overload or disturbed, frame could not be received.
Failure cause		• Check the installation and the proper connection of the SAM Module (Central Gateway or Body Computer) to the CAN vehicle network. • Check correct operating conditions of the CAN controller. • Check the vehicle wirings.
Failure repair		•
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

https://truckmanualshub.com/

520228-9: Timeout error of CAN-Receive-Frame CGWC1.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Fault is detected if a time out of CGWC1 message happens.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• When the frame is received, the time out error will be cleared.
System reaction		• Default value for self heal cycle information is used 100.00-
Failure cause		• CAN bus overload or disturbed, frame could not be received.
Failure repair		• Check CAN bus wiring. A defect could cause error frames which lead to high bus load or send the CAN controller to "bus off" state.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520232-9: Timeout error of CAN-Receive-Frame Dashboard.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously.
		[Fault Detection] • Timeout of DashDspl message
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the DashDspl message is received correct after the debouncing time the DFC is healed.
System reaction		• The default value for tank level is used: • Fl_rTnkQnt = 5.00%;
Failure cause		• Defective CAN controller of Vehicle Control Module or Body controller, under voltage of VCM or Body controller, missing VCM or Body controller, CAN cable connecting the VCM or the Body controller is disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the VCM or Body Controller to the network, Check correct functioning of the VCM or Body Controller CAN controller and its voltage supply. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520233-9: Timeout error of CAN-Transmit-Frame DM1ELight message.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Timeout of DM1ELight message is detected
	[Defect Debouncing] • Defect condition fulfilled continuously >500.00 events
Fault healing	• If the DM1ELight message is transmitted correctly
System reaction	• None
Failure cause	• Defective CAN Controller within Chassis CAN, CAN Cables disconnected or broken. Short circuit in wiring.
Failure repair	• Check the installation and the proper connection of the Engine Control Unit and the Instrument Cluster to the CAN vehicle network. • Check correct operating conditions of the CAN controller. • Check the vehicle wirings.

https://truckmanualshub.com/

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520237-2: Data length error for CAN Receive message EBC1.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Fault is detected when the data length of the EBC1 is not equal to the specified data length in the CANDLC.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Data length of the EBC1 is equal to the specified data length in the CANDLC.
System reaction		• n case of wrong data size, the default values are used: • Brake status StbIntv_stEBSBrkSwt = 3.00- (applied to FALSE) • ABS status StbIntv_stABSEngCtl = 3.00- (applied to FALSE) • ASR engine status StbIntv_stTCSEngCtl = 3.00- (applied to FALSE) • ASR brake status StbIntv_stTCSBrkCtl = 3.00- (applied to FALSE) • Engine shut off demand Com_stEngShOffEBC1 = 3.00- (applied to FALSE) • Driver information Com_stDrvInfo = 3.00- (applied to FALSE)
		• 1) FId / Disable CAN messages EBC1,HRWS,VDC1,WS
Failure cause		• Defective CAN controller of Electronic Brake Controller, wrong configuration of the EBC
Failure repair		• Check presence and correct connection of the EBC to the network, Check correct functioning of the CAN controller. Check wiring. Check EBC configuration
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A28 (DUONIC Control unit) side system.

520237-9: Timeout error of CAN-Receive-Frame Electronic Brake Controller.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • continuously
	[Fault Detection] • Timeout of Electronic Brake Controller 1 message
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the EBC1 message is received correct after the debouncing time the DFC is healed
System reaction	• All state considered as not active, by calibration. • The default values are used: • ASR engine control not active (StbIntv_stTCSEngCtl = 3.00- = 0) • ASR brake control not active (StbIntv_stTCSBrkCtl = 3.00- = 0) • ABS not active (StbIntv_stABSEngCtl = 3.00- = 0) • Brake pedal not pressed (StbIntv_stEBSBrkSwt = 3.00- = 0) NOT USED BY FUSO • Engine shut off demand not active (Com_stEngShOffEBC1 = 3.00- = 0) NOT USED BY FUSO
Failure cause	• Defective CAN controller of ABS / ASR / ESP, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the ABS / ASR / ESP to the network, Check correct functioning of the CAN controller. Check wiring.

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with A1 (Antilock brake system Control unit) is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of A1 (Antilock brake system Control unit). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A1 (Antilock brake system Control unit). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520240-0: Value of NOx sensor is not appropriate.

Generation condition		[Test Condition] • Continuous
		[Fault Detection] • Dew Point detection reached
		[Defect Debouncing] • Defect condition fulfilled continuously >10.0 ms
Fault healing		• Dew point never reached
System reaction		• None except FIDs
		• 1) Fid / Nox sensor defective • 2) Fid/ NOx Sensor not working correctly --> System monitoring with NOx sensor inhibited
Failure cause		• No failure, Dew pont reached!!
Failure repair		• No intervention
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520240-9: Timeout error of CAN-Transmit-Frame EDC to NOx Sensor.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Time out for EDC2NOx CAN message is detected
	[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing	• Time out for EDC2NOx CAN message no more detected

https://truckmanualshub.com/

System reaction		• In case of timeout, the NOx sensor continues to use the previously received dew point status, or the initial one in case no message has been received at all.
		• 1) Fid/ NOx Sensor not working correctly --> System monitoring with NOx sensor inhibited • 2) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Defective CAN controller of EDC, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the EDC to the network, Check correct functioning of the CAN controller. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with B31 (NOx sensor) is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of B31 (NOx sensor). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the B31 (NOx sensor). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of A28 (DUONIC Control unit). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed

Inspection procedure	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520261-9: CAN timeout fault. Error on transmission of CAN message

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • FlEco message timeout detected
		[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing		• No timeout detected
System reaction		• None
Failure cause		• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check the presence and correct connection of the EDC to the network, Check correct functioning of the CAN controller. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520264-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Timeout of INOMAT03 message
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the INOMAT03 message is received correct after the debouncing time the DFC is healed
System reaction	• The value of 'Idle up cancel switch', • Com_stGbxIdlUp is set to replacement value 0.00- (0==Idle up permitted, 1==Idle Up prohibited)
Failure cause	• Defective CAN controller of gearbox, CAN cable connecting the gearbox is disconnected or broken. Short circuit in wiring.
Failure repair	• Check correct connection of the gearbox to the network, check correct functioning of the gearbox CAN controller and its voltage supply. Check wiring.

Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520265-9: Faulty component 'Automatic engine start/stop' / CAN fault

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Fault is detected if a time out of ISS01 message occurs. The message was missing for more than 1 s.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• As soon as the message is again received, the time out error is cleared.
System reaction		• When there is an error in the reception of the frame, the value of Automatic engine stop demand switch status to • inactive status (Frm_stISSStopDemDfl<>1) • Automatic engine start demand switch status to inactive status (Frm_stISSStrtDemDfl<>1) • ISS release demand switch status to • active status (Frm_stISSRlsDemDfl==1) • Override control mode priority switches to lowest priority (invalid signal, Frm_stISSPrioDfl==0)
Failure cause		• CAN bus failure or idle start stop controller failure.
Failure repair		• Check CAN Bus and idle start stop controller.
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A13 (Automatic engine start/stop Control unit) side system.

520267-9: CAN timeout fault: CAN-Transmit-Frame Fuel consumption

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Timeout of LFC message transmission.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.00 events
Fault healing		• No timeout detected
System reaction		• None
Failure cause		• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check the presence and correct connection of the EDC to the network, Check correct functioning of the CAN controller. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520273-0: Component 'NOx sensor' has an open circuit.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this t
	[Fault Detection] • If NOx sensor has detected open wire fault Com_stBytNOxSens[1]==1 (open wire NOx), or Com_stBytNOxSens[2]==1 (open wire linear Lambda), or Com_stBytNOxSens[3]==1 (open wire binary Lambda)
	[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing	• Failure not detected (bit are not set)
System reaction	• NOx value not available. • Further reactions see FIDs
	• 1) Fid/ NOx Sensor not working correctly --> System monitoring with NOx sensor inhibited • 2) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause	• Wiring defect • NOx Sensor defect
Failure repair	• Check wiring • Check NOx Sensor

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and B31.5/4 for open or short circuit. Check the circuit across A4.X2.94/61 and B31.5/3 for open or short circuit. Check the circuit across A20.X10.14/2 and B31.5/1 for open or short circuit. Check the circuit across B31.5/2 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and X42.8/3 for open or short circuit. Check the circuit across A4.X2.94/61 and X42.8/2 for open or short circuit. Check the circuit across A20.X10.14/2 and X42.8/4 for open or short circuit. Check the circuit across X42.8/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B29 (Oxygen sensor) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520273-1: Component 'NOx sensor' has a short circuit.Error detected by sensor.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this t
		[Fault Detection] • If NOx sensor has detected short circuit fault Com_stBytNOxSens[5]==1 (short NOx), or Com_stBytNOxSens[6]==1 (short linear Lambda), or Com_stBytNOxSens[7]==1 (short binary Lambda)
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• Failure not detected (bit are not set)
System reaction		• NOx value not available. • Further reactions see FIDs
		• 1) Fid/ NOx Sensor not working correctly --> System monitoring with NOx sensor inhibited • 2) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Wiring defect • NOx Sensor defect
Failure repair		• Check wiring • Check NOx Sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and B31.5/4 for open or short circuit. Check the circuit across A4.X2.94/61 and B31.5/3 for open or short circuit. Check the circuit across A20.X10.14/2 and B31.5/1 for open or short circuit. Check the circuit across B31.5/2 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and X42.8/3 for open or short circuit. Check the circuit across A4.X2.94/61 and X42.8/2 for open or short circuit. Check the circuit across A20.X10.14/2 and X42.8/4 for open or short circuit. Check the circuit across X42.8/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B29 (Oxygen sensor) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

520276-9: CAN timeout fault: CAN-receive-frame Cruise control parameters from SAM interface

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Timeout of CCVSSAM message is detected
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Timeout of CCVSSAM message no more detected
System reaction		• When there is an error in the reception of the frame • Parking Brake switch status is set to 0.00- (0= not actuated,1=actuated,2=error,3=not available) • Cruise control pause status is set to 1.00- (0= not in pause,1=in pause,2=error,3=not available) • Brake switch status is set to 0.00- (0= not depressed,1=depressed,2=error,3=not available) • Clutch switch status is set to 192.00- (0= not actuated,1=actuated,2=error,3=not available)
Failure cause		• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check the installation and the proper connection of the SAM ECU to the CAN vehicle network. Check correct functioning of the CAN controller. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. 520280-9: CAN timeout fault: CAN-Transmit-Frame Shutdown

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Timeout for ShutDwn message is detected
		[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing		• Message is transmitted
System reaction		• None
Failure cause		• Defective CAN Controller within Chassis CAN, CAN Cables disconnected or broken. Short circuit in wiring.
Failure repair		• Check the installation and the proper connection of the Engine Control Unit to the CAN vehicle network. • Check correct operating conditions of the CAN controller. • Check the vehicle wirings.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520281-9: CAN timeout fault: CAN-receive-frame Tachograph

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Fault is detected if a time out of the message occurs.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• When the frame is received, the time out error is cleared
System reaction	• The default values are used: • the calculated speed of the transmission output shaft (Com_nTCO1CdrS) is replaced by value = 0 • The tachograph vehicle speed (Com_vTCO1Spd) is replaced by value = 0
	• 1) FId / Vehicle speed signal evaluation defective • 2) FId / Disable CAN messages BC2EDC1,BC2EDC2,WM2EDC,DasDispl • 3) FId / Status of function identifier FId_EngDemTrqLimErr1 • 4) FId / Torque limitation 4 activated for power reduction • 5) FId / Underbraking disabled for High and Low engine speed control (HLS) (no special control parameters in case of Underbraking used) • 6) FId / High and Low engine speed demand control (HLS) disabled • 7) FId / Multiple state switch error, PTO disabled • 8) FId / Use of the gear signal for the range check of particulate filter (DPF) is inhibited • 9) FId / Use of the vehicle speed for the range check of particulate filter (DPF) is inhibited • 10) FId / Vehicle speed sensor defective, PGNRQ can message invalid • 11) FId / Closing of metering unit forced (full fuel feeding) • 12) FId / Tooth Angle Adaption (TAA) of crank speed sensor disabled • 13) FId / Zero Fuel Calibration (ZFC) of injectors disabled • 14) FId / Engine speed Limitation 1 for HIgh/Low engine speed (HLS) control active • 15) FId / Run Up test inhibited • 16) FId / Status of function identifier FID_UHCWrmStrtChk; Status des Funktions Identifiers FID_UHCWrmStrtChk • 17) FId / Plausibilty check of temperature sensors at cold start not allowed • 18) FId / Inhibit temperature sampling • 19) FId / Inhibit plaus.check engine coolant temperature at cold start • 20) FId / Fuel temperature plausibility error detected • 21) FId / Inhibit plausibility check of EGR Cooler Temperature Downstream • 22) FId / Vehicle speed value (via CAN) replaced by substitute value if failure is validated
Failure cause	• Defective CAN controller of Tachograph or Instrument Cluster, CAN cable disconnected or broken. Short circuit in wiring.

https://truckmanualshub.com/

Failure repair		• Check presence and correct connection of the Tachograph or of the Instrument Cluster to the network, Check correct functioning of the CAN controller. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with A11 (Meter cluster) is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of A11 (Meter cluster). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A11 (Meter cluster). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520282-9: CAN timeout fault: CAN-Transmit-Frame DEF tank information

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Timeout for TI1 message is detected
		[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing		• Message is acknowledged
System reaction		• None
Failure cause		• Defective CAN Controller within Chassis CAN, CAN Cables disconnected or broken. Short circuit in wiring.
Failure repair		• Check the installation and the proper connection of the Engine Control Unit to the CAN vehicle network. • Check correct operating conditions of the CAN controller. • Check the vehicle wirings.

520286-9: CAN Timeout Error during CAN-Transmit-Frame Electronic Retarder Controller.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Fault is detected if a Timeout of the ERC1 frame has occurred.
	[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing	• Message is acknowledged
System reaction	• None
Failure cause	• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check the presence and correct connection of the EDC to the network, Check correct functioning of the CAN controller. Check wiring.

https://truckmanualshub.com/

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520288-9: CAN Timeout Error during CAN-receive-frame NOx sensor.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this t
	[Fault Detection] • Timeout of NOxSens message.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms

https://truckmanualshub.com/

Fault healing		• If the NOxSens message is received correct after the debouncing time the DFC is healed.
System reaction		• NOX value reset to default value 1.20-
		• 1) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Defective CAN controller of NOx Sensor, undervoltage of NOx Sensor, missing NOx Sensor, CAN cable connecting the NOx Sensor is disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the NOx Sensor to the network, Check correct functioning of the NOx Sensor CAN controller and its voltage supply. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with B31 (NOx sensor) is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of B31 (NOx sensor). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, replace the B31 (NOx sensor). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520297-9: CAN Active DFC TimeOut of Torque Speed Control TSC1AE.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuous
	[Fault Detection] • Timeout of TSC1_AE message.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the TSC1_AE message is received correct after the debouncing time the DFC is healed.
System reaction	• Speed/torque control from ABS/ASR deactivated. • The default values are used: • Override control is disabled, no transmission control (TSC_stATCEngMode = 0x00); • Transient Optimized for driveline disengaged • and non-lockup conditions (TSC_stATCEngSpdCond = 0x00); • Low priority for override control is activated (TSC_stATCEngPrio = 0x03); • Desired speed set at 0 (TSC_nATCEngDes = 0x00); • Desired torque set at 0 (TSC_trqATCEngDes = 0x00);
	• 1) FId / Disable CAN messages HRVD,TImeDate
Failure cause	• Defective CAN controller of ABS / ASR / ESP, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the ABS / ASR / ESP to the network, Check correct functioning of the CAN controller. Check wiring.

		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the TSC1_AR message is received correct after the debouncing time the DFC is healed.
System reaction		• The default values are used: • TSC_stATCRtdrMode = COM_TSC1MODE_DISBL(0x00); • TSC_stATCRtdrPrio = COM_TSC1PRIO_LOW(0x03); • TSC_trqATCRtdrDes = 0x00;
Failure cause		• Defective CAN controller of ABS / ASR / ESP, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the ABS / ASR / ESP to the network, Check correct functioning of the CAN controller. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with A1 (Antilock brake system Control unit) is generated, make a system diagnosis according to the diagnosis code. Go to step2

https://truckmanualshub.com/

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Attach the connector of A1 (Antilock brake system Control unit). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A1 (Antilock brake system Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520309-9: CAN Active DFC TimeOut of Torque Speed Control TSC1TE.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Timeout of TSC1_TE message
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the TSC1_TE message is received correct after the debouncing time the DFC is healed.
System reaction		• Speed/torque control from Gearbox deactivated. • The default values are used: • Override control is disabled, no transmission control • (TSC_stTraEngMode = 0x00); • Transient Optimized for driveline disengaged • (TSC_stTraEngSpdCond = 0x00); • Low priority for override control is activated • (TSC_stTraEngPrio = 0x03); • Desired speed set at 0: TSC_nTraEngDes = 0x00; • Desired torque set at 0: TSC_trqTraEngDes = 0x00;
		• 1) FId / Disable CAN messages ETC1,ETC2
Failure cause		• Defective CAN controller of Transmission Controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the Transmission Controller to the network, Check correct functioning of the CAN controller. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure If one of diagnosis codes associated with A28 (DUONIC Control unit) is generated, make a system diagnosis according to the diagnosis code. 520323-9: CAN Timeout Error during CAN-Transmit-Frame to Electronic Brake Controller.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Timeout of transmitted Electronic Brake Controller 1 message
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the EBC1 message is transmitted correct after the debouncing time the DFC is healed
System reaction		• None
Failure cause		• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check the presence and correct connection of the EDC to the network, Check correct functioning of the CAN controller. Check wiring.
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Inspection procedure Attach the connector of A20 (SAM). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520325-2: Component 'ABS / ASR / ESP®/Electronic brake pressure control' has a configuration fault.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Data length of the VDC1 is not equal to the specified data length in the CAN-DLC.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Data length is correct
System reaction		• The default values are used: • Status of VDC lamp: • StbIntv_stLampActv = 3.00- • Status VDC operativity: • StbIntv_stESPActv = 3.00- • Status brake light request: • StbIntv_stBrkLghtReq = 3.00- • Status roll over prevention engine control: • StbIntv_stRolOvrPrvEng =3.00- • Status roll over prevention brake control: • StbIntv_stRolOvrPrvBrk = 3.00- • Status YC brake control: • StbIntv_stYawCtlEng = 3.00- • Status YC engine control: • StbIntv_stYawCtlBrk = 3.00-
		• 1) FId / Disable CAN messages EBC1,HRWS,VDC1,WS
Failure cause		• Wrong CAN configuration in the ABS/ASR/ESP/EBS
Failure repair		• Check CAN configuration in the ABS/ASR/ESP/EBS
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

https://truckmanualshub.com/

520325-9: Component 'Vehicle dynamics CAN bus' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Fault is detected if a time out of the message occurs.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the VDC1 message is received correct, after the debouncing time the DFC is healed
System reaction		• The default values are used: • Status of VDC lamp: • StbIntv_stLampActv = 3.00- • Status VDC operativity: • StbIntv_stESPActv = 3.00- • Status brake light request: • StbIntv_stBrkLghtReq = 3.00- • Status roll over prevention engine control: • StbIntv_stRolOvrPrvEng =3.00- • Status roll over prevention brake control: • StbIntv_stRolOvrPrvBrk = 3.00- • Status YC brake control: • StbIntv_stYawCtlEng = 3.00- • Status YC engine control: • StbIntv_stYawCtlBrk = 3.00-
Failure cause		• Defective CAN controller of Vehicle Dynamics Control Unit, under voltage of VDCU, missing VDCU, CAN cable connecting the VDCU is disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the VDCU to the network, check correct functioning of the VDCU CAN controller and its voltage supply. Check wiring.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520327-12: ECU internalSPI and COM errorsCY320

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Communication disturbances detected between processor and CY320 (data incorrect or a data transfer is not possible).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Communication correctly restored
System reaction		• None
Failure cause		• ECM internal failure
Failure repair		• Replace ECM
Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

520330-2: SCRTemperature sensorPlausibility error in the dynamic test

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun • Following conditions fulfilled: Engine temperature > 39.96°C {103.93°F}, Exhaust Temperature before SCR > 299.96°C {571.93°F}, NOx Sensor released by FID_DStgyStatNOxSens and Engine Break not active • Exhaust flow > 65.00Kg/h (actual Temperature Difference set to 0, if exhaust flow < 65.00Kg/h)
		[Fault Detection] • The Difference (averaged from 3.43min at 0.00Kg/h over 37.54min at 417.40Kg/h to 24.00min at 650.00Kg/h] “Temperature before - after SCR” > exhaust flow dependant limit (from 137.96°C {280.33°F} at 0.00Kg/h over 130.76°C {267.37°F} at 200.00Kg/h to 110.96°C {231.73°F} at 600.00Kg/h)
		[Defect Debouncing] • Defect condition fulfilled continuously >300000.0 ms
Fault healing		• The “long time” Difference “Temperature before - after SCR” < exhaust flow dependant limit (from 137.96°C {280.33°F} at 0.00Kg/h over 130.76°C {267.37°F} at 200.00Kg/h to 110.96°C {231.73°F} at 600.00Kg/h)
System reaction		• According FID (see FID’s)
		• 1) Fid / Reagent dosing for SCR inhibited • 2) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• One of the SCR Temperature sensors defective • One of the SCR Temperature sensors with corroded connector or defect wiring harness • One of both SCR Temperature sensors not mounted correctly (e.g. not in exhaust flow due to mounting problems) • Temperature increase over SCR due to oil or fuel in exhaust (exothermic reaction): If temperature after SCR much higher than before SCR
Failure repair		• Check the SCR temperature sensors for correct mounting (sensor in exhaust flow, not covered by insulation of SCR housing etc.), correct connectors (no corrosion) and wiring (correct insulation, not broken). • Check temperature sensors and replace them if necessary. • If problem not solved and the temperature measurement OK: Check if there is oil or fuel in the exhaust system (by turbocharger, possibly defective Oxicat etc..)
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520336-31: There is an internal fault in control unit ‘Combustion engine Control unit’.

Generation condition	[Test Condition] • Whenever an erase operation is started.
	[Fault Detection] • If sector erase (Flash memory) cannot be performed or successfully completed, an error will be registered.
	[Defect Debouncing] • Immediate
Fault healing	• None
System reaction	• None except FIDs
	• 1) FId / Inhibit DPF efficiency monitor • 2) FId / Interrupt DPF efficiency monitor • 3) FId / Inhibit monitor for DPF frequent regeneration • 4) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause	• Wrong programming/flashing of the ECM, internal defect of the ECM.
Failure repair	• Try to flash the ECM correctly with a proper dataset, if defect persists: replace ECM.

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

520337-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • At every read access to memory media.
		[Fault Detection] • If at least three memory blocks cannot be read, an error will be registered.
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• For defect Blocks, Replace-Values could be delivered (if provided)
		• 1) Fid / Trip recorder not updated due to EEPROM error • 2) FId / Inhibit DPF efficiency monitor • 3) FId / Interrupt DPF efficiency monitor • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Wrong programming/flashing of the ECM, internal defect of the ECM.
Failure repair		• Try to flash the ECM correctly with a proper dataset, if defect persists: replace ECM.
Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

520338-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • At every write access to memory media.
		[Fault Detection] • If one memory block cannot be written more than 3 times, an error will be registered
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• None except FIDs
		• 1) FId / Inhibit DPF efficiency monitor • 2) FId / Interrupt DPF efficiency monitor • 3) FId / Inhibit monitor for DPF frequent regeneration • 4) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Wrong programming/flashing of the ECM, internal defect of the ECM.
Failure repair		• Try to flash the ECM correctly with a proper dataset, if defect persists: replace ECM.
Inspection procedure	Step1	Inspection procedure Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

520340-0: The efficiency of the exhaust gas recirculation cooler is not sufficient.

Generation condition		[Test Condition] • Following release conditions are considered: stationary engine operating mode is detected, EGR mass flow ASMod_dmEGRDs lies within the thresholds 200.00Kg/h and 30.00Kg/h and A switch-off case not be pending for closed-loop EGR control (AirCtl_stMon = 0; engine temperature EngDa_tEng • lies within the thresholds 111.96°C {233.53°F} and 47.96°C {118.33°F}; average engine speed Epm_nEng lies within the thresholds 3500.00rpm and 2500.00rpm; injection quantity InjCtl_qCurr lies within the thresholds 100.00mg/hub and • 35.00mg/hub; engine operating in normal mode (no regeneration))
		[Fault Detection] • If the measured value EGRClg_tSens_mp is greater than the calculated value EGRClg_tMon_mp, then the EGR cooler is defective. • EGRClg_tMon_mp takes all sensor and system tolerances into account. and depends on the engine speed and the injection quantity.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None except FIDs
		• 1) FId / EGR switched off • 2) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 3) FId / Status of function identifier FId_EngDemTrqLimErr5 • 4) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• EGR cooler efficiency low
Failure repair		• Check EGR cooler
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520344-1: EGR Valve has Under voltage of H-bridge.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Open Load diagnosis not active • Plausibility Check for Short Circuit Overload not active
	[Fault Detection] • Hardware reports Under Voltage error
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Hardware does not report Under Voltage error
System reaction	• Only according FID (see FID's)
	• 1) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 2) FId / EGR switched off • 3) FId / Deactivates NOx monitoring • 4) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / EGR valve closed loop governor and monitoring shut off • 7) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 8) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 9) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 10) Fid / Boost pressure pre control correction depending on EGR disabled • 11) FId / Inhibit DPF monitor • 12) FId / Particulate filter ((DPF) Regeneration inhibited • 13) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 14) FId / Inhibit EGR cooler efficiency monitoring • 15) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 16) FId / Status of function identifier FId_EngDemTrqLimErr5 • 17) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 18) FID / Drift compensation of Air flow meter (HFM/AFS) disabled
Failure cause	• Too high Voltage fluctuations in system • internal failure of ECU
Failure repair	• Check electrical system of vehicle • Replace ECU

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

https://truckmanualshub.com/

520344-3: EGR Valve has a short circuit to ground on Out2 of H-bridge.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Open Load diagnosis not active
	[Fault Detection] • Short Circuit to Battery at Out2 of TLE7209/CJ230 error
	[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing	• To give the possibility for healing, the power stage is enabled each 150.00ms during defect recognition and 300.00ms after definitive failure recognition. • Healing if Hardware does not report “short circuit to battery” (SCB) failure.
System reaction	• Power stage is switched off by disabling the TLE7209/CJ230 chip and the PWM output set to -10.00%. • Further reaction according FID (see FID’s)
	• 1) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 2) FId / EGR switched off • 3) FId / Deactivates NOx monitoring • 4) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / EGR valve closed loop governor and monitoring shut off • 7) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 8) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 9) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 10) Fid / Boost pressure pre control correction depending on EGR disabled • 11) FId / Inhibit DPF monitor • 12) FId / Particulate filter ((DPF) Regeneration inhibited • 13) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 14) FId / Inhibit EGR cooler efficiency monitoring • 15) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 16) FId / Status of function identifier FId_EngDemTrqLimErr5 • 17) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 18) FID / Drift compensation of Air flow meter (HFM/AFS) disabled
Failure cause	• Short circuit of wiring to external source
Failure repair	• Check of wiring

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520344-6: EGR Valve has short circuit or over load of H-bridge.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Open Load diagnosis not active • Failure “Short Circuit to Battery” (SCB) or “short circuit to Ground” (SCG) detected.
	[Fault Detection] • Short Circuit over Load error. • In case of short-circuit-to-ground error, the High side switches are closed with -0.01%. If there is no more short-circuit-to-ground error then it is detected as short-circuit-over-load error. • In case of short-circuit-to-battery error, low side switches are closed with 0.00%. If there is no more short-circuit-to-battery error then it is detected as short-circuit-over-load error. • If short-circuit overload error is detected, then the pre-existing SCG/SCB error is healed.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing	• To give the possibility for healing, the power stage is enabled each 150.00ms during defect recognition and 300.00ms after definitive failure recognition. • Healing if Hardware does not report “short circuit Overload” failure.
System reaction	• Power stage is switched off by disabling the TLE7209/CJ230 chip and the PWM output set to -10.00%. • Further reaction according FID (see FID’s)
	• 1) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 2) FId / EGR switched off • 3) FId / Deactivates NOx monitoring • 4) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 5) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 6) FId / EGR valve closed loop governor and monitoring shut off • 7) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 8) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 9) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 10) Fid / Boost pressure pre control correction depending on EGR disabled • 11) FId / Inhibit DPF monitor • 12) FId / Particulate filter ((DPF) Regeneration inhibited • 13) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 14) FId / Inhibit EGR cooler efficiency monitoring • 15) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 16) FId / Status of function identifier FId_EngDemTrqLimErr5 • 17) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 18) FID / Drift compensation of Air flow meter (HFM/AFS) disabled
Failure cause	• Short circuit of wiring
Failure repair	• Check of wiring

https://truckmanualshub.com/

520344-7: EGR valveJammed open

Generation condition	[Test Condition] • After a governor deviation is detected
	[Fault Detection] • Jammed valve in open state is detected if: • If permanent control deviation exist for a time greater than 300.00ms • Valve release attempts have failed (5.00- trials) • EGR actuator position is <= 15.00%
	[Defect Debouncing] • 300.00ms after last release trial
Fault healing	• Healing not possible in same driving cycle, when fault condition don't subsists (governor deviation healed or release succeeds)
System reaction	• Timer for repeated release function becomes active and the governor is shutoff.
	• 1) FId / Failure detection of physical range check of air flow meter (HFM/AFS) disabled (DFC_AFSPhysRngHi and DFC_AFSPhysRngLo) • 2) FId / EGR switched off • 3) FId / Deactivates NOx monitoring • 4) FId / Afterrun Functions suppressed (partially monitoring and learning in afterrun) • 5) Fid / Plausibility check Boost pressure with ambient pressure inhibited • 6) Fid / Boost pressure pre control correction depending on EGR disabled • 7) FId / Particulate filter ((DPF) Regeneration inhibited • 8) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 9) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 10) FId / Inhibit EGR cooler efficiency monitoring • 11) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled • 12) FID / Drift compensation of Air flow meter (HFM/AFS) disabled • 13) FId / Status of function identifier FId_EngDemTrqLimErr5 • 14) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active
Failure cause	• EGR valve can not be closed as desired within expected time • EGR valve blocked mechanically • EGR valve sticks • EGR valve position sensor mismatched
Failure repair	• Check Functionality of EGR valve and the corresponding position

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at A14 (EGR valve). Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A14 (EGR valve). Check the circuit across A4.X1.60/50 and Y8.X7.5/2 for open or short circuit. Check the circuit across A4.X1.60/35 and Y8.X7.5/1 for open or short circuit. Check the circuit across A4.X1.60/29 and B21.X7.5/5 for open or short circuit. Check the circuit across A4.X1.60/27 and B21.X7.5/4 for open or short circuit. Check the circuit across A4.X1.60/33 and B21.X7.5/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “A14 (EGR valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of A14 (EGR valve) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520347-31: Injection cutoff demand for shutoff coordinator

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • If engine speed Epm_nEng > 1600.00rpm.
	[Defect Debouncing] • Immediate.
Fault healing	• If engine speed Epm_nEng < 1600.00rpm.

https://truckmanualshub.com/

System reaction		• If threshold of 1500.00rpm is reached try to limit speed increase by reducing fuel injection, if a second threshold of 1600.00rpm is reached, cut injection off.
		• 1) FId / Fuel quantity set to (= engine stop) • 2) FId / Engine torque forced to (=engine stop)
Failure cause		• Another failure requested engine speed limitation. • This failure path should always appear in failure memory with another lead failure from ECM monitoring level (level 2)
Failure repair		• No action, this is only an information path
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520348-0: Signal Range Check (SRC) for 'Exhaust temperature upstream of oxidation catalytic converter' reports HIGH.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Monitoring not inhibited by FId_EnhSRCT1ExhTMon due to another failure
		[Fault Detection] • Exhaust Temperature before Oxicat > 649.96°C {1201.93°F}
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing		• Measured temperature < 649.96°C {1201.93°F}
System reaction		• Only by FID (see FID's)
		• 1) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 2) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 3) FId / Substitute calibration array is used to determinate the regeneration lock-out time of particulate filter (DPF) • 4) FId / Integrators of the soot mass simulation of particulate filter (DPF) are initialized with the value of the residual soot mass calculation after a successful regeneration • 5) FId / Substitute parameter set of maximum values is used for the calculation of fuel consumption, operating hours and distance covered since the last successful regeneration of particulate filter (DPF) • 6) FId / Particulate filter ((DPF) Regeneration inhibited • 7) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 8) FId / Inhibit DPF upstream Temperature sensor adaption • 9) FId / Inhibit OxiCat passive monitor • 10) FId / Engine protection DPF regeneration inhibited due to faulty input signals
Failure cause		• Exhaust Temperature Sensor before Oxicat measures wrong values or interchanged with Temperature before Oxicat
Failure repair		• Check wiring and connectors for correct contact (corrosion). • Check sensor and replace it if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Incorrect assembly of B28 (Temperature sensor "SCR catalytic converter" 1), B32 (Temperature sensor "SCR catalytic converter" 2) For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B32 (Temperature sensor “SCR catalytic converter” 2). Check the circuit across A4.X2.94/55 and B32.2/1 for open or short circuit. Check the circuit across A4.X2.94/9 and B32.2/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Inspection procedure Turn the starter switch in OFF. Replace component “B32 (Temperature sensor “SCR catalytic converter” 2)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. Incorrect assembly of B28 (Temperature sensor “SCR catalytic converter” 1), B32 (Temperature sensor “SCR catalytic converter” 2) For procedures, refer to the Shop Manual. Go to Step8
	Step8	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step9
	Step9	Inspection completed
	Step10	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Check the circuit across A4.X2.94/55 and X42.8/8 for open or short circuit. Check the circuit across A4.X2.94/9 and X42.8/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Inspection procedure Repair or replace the harness across B32 (Temperature sensor “SCR catalytic converter” 2) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step12	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

520352-0: Corrected energizing time of Zero Fuelling Calibration for injector 1 TOO HIGH

Generation condition	[Test Condition] • Zero fuel calibration not inhibited by FId_ZFCClbActv or ZFCPCLClbActv due to other failures • Intake air temperature > -8.04°C {17.53°F} • Fuel temperature between -0.04°C {31.93°F} and 79.96°C {175.93°F}. • Engine temperature > 62.96°C {145.33°F} • System Voltage > 10.00V • Air conditioner: pressure < 2MPa {290psi, 20kgf/cm^2} • Accelerator Pedal Position < 0.01% • Clutch not pressed • System in overrun, but not longer than a time, which is dependant on intake air temperature (from 0.00ms at -8.04°C {17.53°F} over 10000.00ms at 9.96°C {49.93°F} and 25000.00ms at 39.96°C {103.93°F} to 25000.00ms at 106.86°C {224.35°F}), but longer than 0.00ms. • Engine speed between (1000.00rpm - 30.00rpm) and (2000.00rpm + 30.00rpm) • Vehicle speed > threshold depending on fuel pressure set point: • At set point 0 35MPa {5080psi, 355kgf/cm^2} > 0km/h {0mph} • At set point 0 60MPa {8700psi, 610kgf/cm^2} > 0km/h {0mph} • At set point 0 80MPa {11600psi, 815kgf/cm^2} > 0km/h {0mph} • At set point 0 100MPa {14500psi, 1020kgf/cm^2} > 0km/h {0mph} • At set point 0 130MPa {18850psi, 1330kgf/cm^2} > 0km/h {0mph} • At set point 0 160MPa {23200psi, 1630kgf/cm^2} > 0km/h {0mph} • Rail pressure must be reached since 300.00ms • If 1.00- learning cycles were executed successfully, a minimal distance > 1000.00km has to be driven, before next learning cycles starts (this time only for 5.00- learning cycles). No gear change occurring • The sensor wheel adaptation must be executed correctly
	[Fault Detection] • If the energising time of the corrected “zero quantity”, exceeds the maximum energising time in at least one of the calibration points for cylinder 1: • (382.00us-20.40us) at pressure set point 35MPa {5080psi, 355kgf/cm^2} • (301.20us-14.40us) at pressure set point 60MPa {8700psi, 610kgf/cm^2} • (272.40us-11.20us) at pressure set point 80MPa {11600psi, 815kgf/cm^2} • (248.00us-10.00us) at pressure set point 100MPa {14500psi, 1020kgf/cm^2} • (223.20us-9.20us) at pressure set point 130MPa {18850psi, 1330kgf/cm^2} • (208.00us-8.80us) at pressure set point 160MPa {23200psi, 1630kgf/cm^2}
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 ms
Fault healing	• If the energising time of the corrected “zero quantity” are all below maximum value for cylinder 1
System reaction	• None except FIDs
	• 1) FId / Inhibit OxiCat passive monitor • 2) FId / Inhibit DPF efficiency monitor • 3) FId / Interrupt DPF efficiency monitor • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause	• Clogged nozzles in the injector of cylinder 1, mechanical defect partially jamming the valve lift, implausible lambda signal
Failure repair	• Check injector of cylinder 1 for blocked nozzles and jammed valve needle, check lambda sensor for plausible signals, replace injector if necessary

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). If corresponding fault codes are also present on other components, check the common power supply and common ground point “ for open circuit and short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step3 Yes: Go to step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y15 (Fuel injector 1)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Perform coding of Y15 (Fuel injector 1) which A4 (Combustion engine Control unit) learns. Go to step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step5 Yes: Go to step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step5 Yes: Go to step3

520354-0: Corrected energizing time of Zero Fuelling Calibration for injector 4 TOO HIGH

Generation condition		[Test Condition] • Zero fuel calibration not inhibited by FId_ZFCClbActv or ZFCPCLClbActv due to other failures • Intake air temperature > -8.04°C {17.53°F} • Fuel temperature between -0.04°C {31.93°F} and 79.96°C {175.93°F}. • Engine temperature > 62.96°C {145.33°F} • System Voltage > 10.00V • Air conditioner: pressure < 2MPa {290psi, 20kgf/cm^2} • Accelerator Pedal Position < 0.01% • Clutch not pressed • System in overrun, but not longer than a time, which is dependant on intake air temperature (from 0.00ms at -8.04°C {17.53°F} over 10000.00ms at 9.96°C {49.93°F} and 25000.00ms at 39.96°C {103.93°F} to 25000.00ms at 106.86°C {224.35°F}), but longer than 0.00ms. • Engine speed between (1000.00rpm - 30.00rpm) and (2000.00rpm + 30.00rpm) • Vehicle speed > threshold depending on fuel pressure set point: • At set point 0 35MPa {5080psi, 355kgf/cm^2} > 0km/h {0mph} • At set point 0 60MPa {8700psi, 610kgf/cm^2} > 0km/h {0mph} • At set point 0 80MPa {11600psi, 815kgf/cm^2} > 0km/h {0mph} • At set point 0 100MPa {14500psi, 1020kgf/cm^2} > 0km/h {0mph} • At set point 0 130MPa {18850psi, 1330kgf/cm^2} > 0km/h {0mph} • At set point 0 160MPa {23200psi, 1630kgf/cm^2} > 0km/h {0mph} • Rail pressure must be reached since 300.00ms • If 1.00- learning cycles were executed successfully, a minimal distance > 1000.00km has to be driven, before next learning cycles starts (this time only for 5.00- learning cycles). No gear change occurring • The sensor wheel adaptation must be executed correctly
		[Fault Detection] • If the energising time of the corrected “zero quantity”, exceeds the maximum energising time in at least one of the calibration points for cylinder 4: • (382.00us-20.40us) at pressure set point 35MPa {5080psi, 355kgf/cm^2} • (301.20us-14.40us) at pressure set point 60MPa {8700psi, 610kgf/cm^2} • (272.40us-11.20us) at pressure set point 80MPa {11600psi, 815kgf/cm^2} • (248.00us-10.00us) at pressure set point 100MPa {14500psi, 1020kgf/cm^2} • (223.20us-9.20us) at pressure set point 130MPa {18850psi, 1330kgf/cm^2} • (208.00us-8.80us) at pressure set point 160MPa {23200psi, 1630kgf/cm^2}
		[Defect Debouncing] • Defect condition fulfilled continuously >1.00 ms
Fault healing		• If the energising time of the corrected “zero quantity” are all below maximum value for cylinder 4
System reaction		• None except FIDs
		• 1) FId / Inhibit OxiCat passive monitor • 2) FId / Inhibit DPF efficiency monitor • 3) FId / Interrupt DPF efficiency monitor • 4) FId / Inhibit monitor for DPF frequent regeneration • 5) FId / Inhibit monitor for incomplete regeneration of the DPF • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Clogged nozzles in the injector of cylinder 4, mechanical defect partially jamming the valve lift, implausible lambda signal
Failure repair		• Check injector of cylinder 4 for blocked nozzles and jammed valve needle, check lambda sensor for plausible signals, replace injector if necessary
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y18 (Fuel injector 4). If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step3 Yes: Go to step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y18 (Fuel injector 4)”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Perform coding of Y18 (Fuel injector 4) which A4 (Combustion engine Control unit) learns. Go to step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step5 Yes: Go to step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step5 Yes: Go to step3

	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step5 Yes: Go to step3

520357-0: A fault was detected during regeneration of the diesel particulate filter.The current value for the ‘Exhaust temperature upstream of diesel particulate filter’ component is too low.

Generation condition	[Test Condition] • Engine speed and load within a specified range (by calibration) for more than 0.00s. • Engine in “steady state condition, i.e. the variation of the exhaust temperature < 30.00K since 10.00s. • Regeneration and outer control loop active, i.e. the Adapted DPF upstream temperature in interval between 561.96°C {1043.53°F} and 699.96°C {1291.93°F} but at least 149.96°C {301.93°F} (to guarantee burning of fuel) for at least 1.50s resp. not longer than 0.00s outside this range.
	[Fault Detection] • If the controller is on maximum output and the Temperature after Oxicat is lower than the desired one by more than an engine speed and load dependant threshold, but at least > 0.00K.
	[Defect Debouncing] • Defect condition fulfilled continuously > 30000.0 ms
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

System reaction		• According FID (see FID's)
		• 1) FId / Inhibit OxiCat passive monitor
Failure cause		• Difficult ambient conditions resp vehicle use (demanded temperature can not reached due to ambient conditions) • Problems with temperature measurement after Oxicat (sensor defect or sensors before/after Oxicat interchanged) • Oxicat defective (does not burn fuel) • Problems with injection system (too low post injection quantity)
Failure repair		• Check Temperature sensors • Check Oxicat (execute service regeneration --> does tempa fter Oxicat increase with activated Post injection?) • Check injection system
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If this diagnosis code has occurred during operation in an extremely low temperature environment, investigate the driving conditions at that time because it may have been temporary. Check the installation condition of B23 (Temperature sensor Exhaust system 1) and B24 (Temperature sensor 'Exhaust system' 2) If proper temperature can not be attained even after conducting DPF regeneration, faulty DPF is suspected. Repair or replace the DPF. If one of diagnosis codes associated with {0} is generated, make a system diagnosis according to the diagnosis code. For procedures, refer to the Shop Manual Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X2.94/12 and B24.2/1 for open circuit. Check electrical line between pins A4.X2.94/63 and B24.2/2 for open circuit. Check electrical line between pins A4.X2.94/12 and B24.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B24 (Temperature sensor Exhaust system 2) for short-circuit to another line. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B24 (Temperature sensor Exhaust system 2)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step8

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

520357-1: A fault was detected during regeneration of the diesel particulate filter.The current value of component 'Exhaust temperature upstream of diesel particulate filter' is too high.

Generation condition		[Test Condition] • Engine speed and load within a specified range (by calibration) for more than 0.00s. • Engine in "steady state condition, i.e. the variation of the exhaust temperature < 30.00K since 10.00s. • Regeneration and outer control loop active, i.e. the Adapted DPF upstream temperature in interval between 561.96°C {1043.53°F} and 699.96°C {1291.93°F} but at least 149.96°C {301.93°F} (to guarantee burning of fuel) for at least 1.50s resp. not longer than 0.00s outside this range.
		[Fault Detection] • If the controller is on minimum output and the Temperature after Oxicat is higher than desired by more than an engine speed and load dependant threshold, but at least > 0.00 °K.
		[Defect Debouncing] • Defect condition fulfilled continuously > 30000.0 ms
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• According FID (see FID's)
		• 1) FId / Inhibit OxiCat passive monitor
Failure cause		• Problems with temperature measurement after Oxicat (sensor measures much too high temp) • Problems with injection system (too high post injection quantity)
Failure repair		• Check Temperature sensors • Check Oxicat (execute service regeneration --> does tempa fter Oxicat increase with activated Post injection?) • Check injection system
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If proper temperature can not be attained even after conducting DPF regeneration, faulty DPF is suspected. Repair or replace the DPF. If one of diagnosis codes associated with {0} is generated, make a system diagnosis according to the diagnosis code. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X2.94/12 and B24.2/1 for open circuit. Check electrical line between pins A4.X2.94/63 and B24.2/2 for open circuit. Check electrical line between pins A4.X2.94/12 and B24.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B24 (Temperature sensor Exhaust system 2) for short-circuit to another line. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B24 (Temperature sensor Exhaust system 2)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

520357-31: A fault was detected during regeneration of the diesel particulate filter.Regeneration takes too long.

Generation condition	[Test Condition] • Regeneration and outer control loop active, i.e. the Adapted DPF upstream temperature in interval between 561.96°C {1043.53°F} and 699.96°C {1291.93°F} but at least 149.96°C {301.93°F} (to guarantee burning of fuel) for at least 1.50s resp. not longer than 0.00s outside this range.
	[Fault Detection] • The control for increased temperature after Oxicat (i.e. Post injection) is active longer than an exhaust gas temperature dependant threshold (from 120.00s at -0.04°C {31.93°F} over 120.00s at 149.96°C {301.93°F} and 120.00s at 399.96°C {751.93°F} to 120.00s at 799.96°C {1471.93°F}), corrected by an engine speed and load dependant factor and frozen to the maximum value obtained during the monitoring period.
	[Defect Debouncing] • Defect condition fulfilled continuously > 1.00 events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• According FID (see FID's)
	• 1) FId / Inhibit OxiCat passive monitor
Failure cause	• Problems with temperature measurement after Oxicat (sensor defect or sensors before/after Oxicat interchanged) • Oxicat defective (does not burn fuel) • Problems with injection system (too low post injection quantity)
Failure repair	• Check Temperature sensors • Check Oxicat (execute service regeneration --> does tempa fter Oxicat increase with activated Post injection?) • Check injection system

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check the installation condition of B23 (Temperature sensor Exhaust system 1) and B24 (Temperature sensor 'Exhaust system' 2) If proper temperature can not be attained even after conducting DPF regeneration, faulty DPF is suspected. Repair or replace the DPF. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. For procedures, refer to the Shop Manual Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Check electrical line between pins A4.X2.94/12 and B24.2/1 for open circuit. Check electrical line between pins A4.X2.94/63 and B24.2/2 for open circuit. Check electrical line between pins A4.X2.94/12 and B24.2/1 for short circuit to positive. Check harness between A4 (Combustion engine Control unit) and B24 (Temperature sensor Exhaust system 2) for short-circuit to another line. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B24 (Temperature sensor Exhaust system 2)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

520358-2: Exhaust Flap actuator has sticking valve or loose connection.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously
	[Fault Detection] • Sticking counter exceeds 5.00-
	[Defect Debouncing] • Immediate

https://truckmanualshub.com/

Fault healing		• Exhaust flap not sticking for at least 800.00ms
System reaction		• None except FIDs
		• 1) FId / Inhibit Charged Air Cooler monitoring
Failure cause		• Electrical problem in exhaust flap (loose connection) or sticking flap
Failure repair		• Check exhaust flap, check electrical connection
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code.
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y9 (Engine brake Solenoid valve). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X1.60/34 and Y9.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and Y9.3/3 for open or short circuit. Check the circuit across Ground and Y9.3/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y9 (Engine brake Solenoid valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across Ground and X39.12/8 for open or short circuit. Check the circuit across A20.X10.14/2 and X39.12/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across Y9 (Engine brake Solenoid valve) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step9	Inspection procedure Repair or replace the harness across A20 (SAM) and X39. Repair or replace the harness across Ground and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520359-2: Exhaust Flap actuator reports an error by a defined SCG duration of PWM wiring (X2 Error).

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously
		[Fault Detection] • The Exhaust Flap Power stage reports the failure class 3 “Flap closed blocked”: “Overtemperature” OR “Supply voltage out of range” or “Wrong PWM command” (SCG active for 600mse and inactive 400ms).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00 events • Failure is detected if active for 25% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• The Flap is actuated with 5.00%, i.e. the Exhaust brake does no more work. • Further reactions according FID (see FID’s)
		• 1) FId / Exhaust flap position (PWM) set to fix replacement value (ExhFlpLP_Cal.rPwrStgDis_C) • 2) FId / Particulate filter ((DPF) Regeneration inhibited • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / Inhibit Charged Air Cooler monitoring
Failure cause		• Exhaust flap too hot (due to bad cooling or too high current due to electrical problem) • Supply wiring defect / or ECM Supply to Exhaust flap actuator defect • PWM wiring defect (sporadic interruptions lead to “wrong PWM” detection)
Failure repair		• Check exhaust flap actuator and wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y9 (Engine brake Solenoid valve). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X1.60/34 and Y9.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and Y9.3/3 for open or short circuit. Check the circuit across Ground and Y9.3/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y9 (Engine brake Solenoid valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across Ground and X39.12/8 for open or short circuit. Check the circuit across A20.X10.14/2 and X39.12/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across Y9 (Engine brake Solenoid valve) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A20 (SAM) and X39. Repair or replace the harness across Ground and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520360-2: Exhaust Flap actuator reports an error by a defined SCG duration of PWM wiring (X Error).

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously
	[Fault Detection] • The Exhaust Flap actuator reports the failure class 1 “Flap blocked in closed position (SCG active for 200mse / inactive 800ms)
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00 events • Failure is detected if active for 25% of events
Fault healing	• No Healing possible (disabled by Data set)

https://truckmanualshub.com/

System reaction		• The Flap is actuated with 5.00%, i.e. the Exhaust brake does no more work. • Further reactions according FID (see FID's)
		• 1) Fid / Exhaust flap position (PWM) set to fix replacement value (ExhFlpLP_Cal.rPwrStgDis_C) • 2) FId / Status of function identifier FId_EngDemTrqLimErr1 • 3) FId / Torque limitation 2 activated for power reduction • 4) FId / Engine speed Limitation 2 for HIgh/Low engine speed (HLS) control active • 5) FId / Particulate filter ((DPF) Regeneration inhibited • 6) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 7) FId / EGR switched off • 8) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 9) FId / Inhibit Charged Air Cooler monitoring • 10) FId / Zero Fuel Calibration (ZFC) of injectors by Lambda Sensor signal disabled
Failure cause		• Exhaust flap mechanically blocked in closed position • Internal failure in Exhaust flap actuator.
Failure repair		• Check exhaust flap actuator and wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code.
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y9 (Engine brake Solenoid valve). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X1.60/34 and Y9.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and Y9.3/3 for open or short circuit. Check the circuit across Ground and Y9.3/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "Y9 (Engine brake Solenoid valve)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across Ground and X39.12/8 for open or short circuit. Check the circuit across A20.X10.14/2 and X39.12/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across Y9 (Engine brake Solenoid valve) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A20 (SAM) and X39. Repair or replace the harness across Ground and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520361-2: Exhaust Flap actuator reports an error by a defined SCG duration of PWM wiring (Y2 Error).

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously
		[Fault Detection] • The Exhaust Flap Power stage reports the failure class 4, which means “EEPROM fault, i.e. a fatal error inside the electronic part of the Exhaust flap actuator. (SCG active 800ms and inactive 200ms)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00 events • Failure is detected if active for 25% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• The Flap is actuated with 5.00%, i.e. the Exhaust brake does no more work. • Further reactions according FID (see FID’s)
		• 1) FId / Exhaust flap position (PWM) set to fix replacement value (ExhFlpLP_Cal.rPwrStgDis_C) • 2) FId / Particulate filter ((DPF) Regeneration inhibited • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / Inhibit Charged Air Cooler monitoring
Failure cause		• Fatal failure of the electronic part inside the Exhaust flap actuator.
Failure repair		• Check exhaust flap actuator and wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y9 (Engine brake Solenoid valve). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X1.60/34 and Y9.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and Y9.3/3 for open or short circuit. Check the circuit across Ground and Y9.3/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “Y9 (Engine brake Solenoid valve)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across Ground and X39.12/8 for open or short circuit. Check the circuit across A20.X10.14/2 and X39.12/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across Y9 (Engine brake Solenoid valve) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A20 (SAM) and X39. Repair or replace the harness across Ground and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520362-2: Exhaust Flap actuator reports an error by a defined SCG duration of PWM wiring (Y Error).

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously
		[Fault Detection] • The Exhaust Flap Power stage reports the Failure 2 which means: • Flap blocked in intermediate or opened position OR • Over current detected • Sensor fault detected • (SCG active for 400mse / inactive 600ms)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 25% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• The Flap is actuated with 5.00%, i.e. the Exhaust brake does no more work. • Further reactions according FID (see FID's)
		• 1) FId / Exhaust flap position (PWM) set to fix replacement value (ExhFlpLP_Cal.rPwrStgDis_C) • 2) FId / Particulate filter ((DPF) Regeneration inhibited • 3) FId / Service regeneration of Particulate filter ((DPF) inhibited (due to DPF failure) • 4) FId / Inhibit Charged Air Cooler monitoring
Failure cause		• Exhaust flap mechanically blocked or high movement resistance • Internal failure in Exhaust flap actuator.
Failure repair		• Check exhaust flap actuator
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code.
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y9 (Engine brake Solenoid valve). Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X1.60/34 and Y9.3/1 for open or short circuit. Check the circuit across A20.X10.14/2 and Y9.3/3 for open or short circuit. Check the circuit across Ground and Y9.3/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "Y9 (Engine brake Solenoid valve)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step Yes: Go to Step5
	Step5	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step6	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X39. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across Ground and X39.12/8 for open or short circuit. Check the circuit across A20.X10.14/2 and X39.12/7 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across Y9 (Engine brake Solenoid valve) and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A20 (SAM) and X39. Repair or replace the harness across Ground and X39. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520364-2: More than one exhaust temperature sensors are defect.

Generation condition	[Test Condition] • once in a driving cycle if following conditions are true: • monitoring not disabled by FID_ExhTMonPlausTemp due to another failure. • Not in high altitude (ambient pressure > 50kPa {7.3psi, 0.5kgf/cm^2} • The time since last engine stop > 5.00h (time usually taken via CAN from tachograph). • In case the timer or the CAN transmission is defective, the monitoring is inhibited (by FID_ExhTMonPlausTemp)
	[Fault Detection] • If more than 1 of the sensors compared to each other shows too high deviation. Following sensors are compared: Exhaust Temperature Sensor before Oxicat and Exhaust Temperature Sensor after Oxicat (if available) and Exhaust Temperature Sensor before DPF (if available) and Exhaust Temperature Sensor after DPF (if available) and Exhaust Temperature Sensor after DPF (if available) and Exhaust Temperature Sensor after DPF (if available)
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• Healing only at next driving cycle possible, if test conditions fulfilled. Healing if all temperatures similar OR a clear identification of a defective sensor possible (in this case a dedicated failure path stored)
System reaction	• Only according FID (see FID)
	• 1) FId / Inhibit OxiCat passive monitor • 2) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 3) FId / Monitoring for the destroyed particle filter (DPF) by minimal flow resistance disabled • 4) FId / Inhibit DPF efficiency monitor • 5) FId / Interrupt DPF efficiency monitor • 6) FId / Inhibit monitor for DPF frequent regeneration • 7) FId / Inhibit monitor for incomplete regeneration of the DPF • 8) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)

https://truckmanualshub.com/

Failure cause		• Several sensors have wrong measurement values. • Too fast change of ambient temperature (e.g. due to sun shining in the morning after cold night.) --> see ambient conditions
Failure repair		• Check with ambient conditions, which sensors show highest deviation form intake air temperature in AFS, Boost temperature and Coolant temperature. If Boost temperature and coolant temperature are similar but higher than the exhaust temperatures --> failure caused probably by “fast ambient temperature change” --> no action needed. • Else identify sensors which deviate most from the intake air temperature. • Note: Too fast ambient temperature change, e.g. vehicle (and dedicated temperature sensor) exposed to sun shine after very cold night, or if the sensor is in a “warm air stream” (e.g. by additional engines like a cooling compressor for a cold compartment which runs also during vehicle stand still, or an external source like a “exhaust stream” of a building climatisation) can cause this failure, if the ambient of this sensor is not equal to the “normal” ambient! --> in this case no action needed!
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520379-0: Corrected value of injection quantity is too high.

Generation condition		[Test Condition] • Continuously monitoring
		[Fault Detection] • Error is detected when the total quantity correction minus the current value exceeds the limit defined in the map. • AND • The correction quantity from the learning map minus the current value exceeds the limit from the map.
		[Defect Debouncing] • Defect condition fulfilled continuously > 30000.0 ms
Fault healing		• Correction quantity in range
System reaction		• None except FIDs
		• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 3) FId / Inhibit DPF monitor • 4) FId / Inhibit Charged Air Cooler monitoring • 5) FId / Inhibit EGR cooler efficiency monitoring • 6) FId / Calculation of Turbocharger Compressor Temperature inhibited • 7) FId / Inhibit monitor for DPF frequent regeneration • 8) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Calculated lambda may be wrong: air mass meter defect or injectors defect. Measured lambda-value wrong, check lambda sensor.
Failure repair		• Check air mass meter, injectors and lambda sensor.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B18 (Air flow and intake air temperature sensor) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Y2 Valve is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across B29.6/6 and A4.X2.94/78 for open or short circuit. Check the circuit across B29.6/1 and A4.X2.94/76 for open or short circuit. Check the circuit across B29.6/3 and A4.X2.94/51 for open or short circuit. Check the circuit across B29.6/2 and A4.X2.94/86 for open or short circuit. Check the circuit across B29.6/4 and A20.X10.14/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520379-1: Corrected value of injection quantity is too low.

Generation condition	[Test Condition] • Continuously monitoring
	[Fault Detection] • Error is detected when the total quantity correction minus the current value falls below the limit defined in the map. • AND • The correction quantity from the learning map minus the current value falls below the limit from the map.
	[Defect Debouncing] • Defect condition fulfilled continuously > 30000.0 ms
Fault healing	• Correction quantity in range

https://truckmanualshub.com/

System reaction		• None except FIDs
		• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks) • 2) FId / Monitoring of particulate filter (DPF) by comparing the calculated flow resistance with measured pressure drop disabled • 3) FId / Inhibit DPF monitor • 4) FId / Inhibit Charged Air Cooler monitoring • 5) FId / Inhibit EGR cooler efficiency monitoring • 6) FId / Calculation of Turbocharger Compressor Temperature inhibited • 7) FId / Inhibit monitor for DPF frequent regeneration • 8) FId / Inhibit monitor for incomplete regeneration of the DPF
Failure cause		• Calculated lambda may be wrong: air mass meter defect or injectors defect. Measured lambda-value wrong, check lambda sensor.
Failure repair		• Check air mass meter, injectors and lambda sensor.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with B18 (Air flow and intake air temperature sensor) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Y2 Valve is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across B29.6/6 and A4.X2.94/78 for open or short circuit. Check the circuit across B29.6/1 and A4.X2.94/76 for open or short circuit. Check the circuit across B29.6/3 and A4.X2.94/51 for open or short circuit. Check the circuit across B29.6/2 and A4.X2.94/86 for open or short circuit. Check the circuit across B29.6/4 and A20.X10.14/2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component “B29 (Oxygen sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of B29 (Oxygen sensor) which A4 (Combustion engine Control unit) learns. Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520380-12: Component '10271-494' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • continuously
		[Fault Detection] • The NOx Sensor sends the message "Sensor temperature not OK" (Bits 0-1 = 00)
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• The NOx Sensor sends the message "Sensor temperature OK" (Bits 0-1 = 01)
System reaction		• According FID (see FID's) • Usually the NOx signal is set to FFFF by the Sensor itself which causes a fix NOx concentration of 1.20-.
		• 1) Fid/ NOx Sensor not working correctly --> System monitoring with NOx sensor inhibited • 2) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Defective NOx sensor heating
Failure repair		• Check wiring harness • Check NOx Sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and B31.5/4 for open or short circuit. Check the circuit across A4.X2.94/61 and B31.5/3 for open or short circuit. Check the circuit across A20.X10.14/2 and B31.5/1 for open or short circuit. Check the circuit across B31.5/2 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B29 (Oxygen sensor)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and X42.8/3 for open or short circuit. Check the circuit across A4.X2.94/61 and X42.8/2 for open or short circuit. Check the circuit across A20.X10.14/2 and X42.8/4 for open or short circuit. Check the circuit across X42.8/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Inspection procedure Repair or replace the harness across B29 (Oxygen sensor) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

520380-31: NOx sensor: The power supply is faulty.

Generation condition	[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • continuously
	[Fault Detection] • The NOx Sensor sends the message "Supply not OK" (Bits 6-7 = 00)
	[Defect Debouncing] • Defect condition fulfilled continuously >20000.0 ms
Fault healing	• The NOx Sensor sends the message "Supply OK" (Bits 6-7 = 01)

https://truckmanualshub.com/

System reaction		• According FID (see FID's) • Usually the NOx signal is set to FFFF by the Sensor itself which causes a fix NOx concentration of 1.20-.
		• 1) Fid/ NOx Sensor not working correctly --> System monitoring with NOx sensor inhibited • 2) Fid/ SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Defective NOx sensor supply
Failure repair		• Check wiring harness • Check NOx Sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B29 (Oxygen sensor). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and B31.5/4 for open or short circuit. Check the circuit across A4.X2.94/61 and B31.5/3 for open or short circuit. 	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of X42 (Intermediate connector). Remove the connector of A20 (SAM). Check the circuit across A4.X2.94/62 and X42.8/3 for open or short circuit. Check the circuit across A4.X2.94/61 and X42.8/2 for open or short circuit. Check the circuit across A20.X10.14/2 and X42.8/4 for open or short circuit. Check the circuit across X42.8/1 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Repair or replace the harness across B29 (Oxygen sensor) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3
	Step9	Inspection procedure Repair or replace the harness across A4 (Combustion engine Control unit) and X42 (Intermediate connector). Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

520382-31: Test internal resistance of component 'R9/1 (Cylinder 1 glow plug)'.: Implausible data

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Only if glow plug are actuated and no other glow plug failure already detected.
		[Fault Detection] • Glow plug resistance GlwCtl_resGlpRstnEff_mp is not between thresholds determined by the map GlwCtl_resGlpRstnEffThresHi_MAP or GlwCtl_resGlpRstnEffThresLo_MAP. The input values of the map are the derivation of the glow plug current and the effective glow plug voltage.
		[Defect Debouncing] • Defect condition fulfilled continuously >3000.0 ms
Fault healing		• Glow plug resistance is in range
System reaction		• None
Failure cause		• Glow Plug resistance not matching specification: wiring problem, defective glow plug or glow plug installed not matching dataset application
Failure repair		• Check wiring, check glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520386-9: Control unit GCU4 has LIN timeout error while receiving glow plug current information.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Continuously if not inhibited by LIN BUS Off failure
		[Fault Detection] • TimeOut of Receive Frame GLP_CURB1 (0x18) is determined (receive frame glow plug current)
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• Time out no more detected
System reaction		• None
Failure cause		• LIN Disturbance, glowplug connection interruption, defective glow plug
Failure repair		• Check LIN connection, check glow plugs
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520387-9: Control unit GCU4 has LIN timeout error while receiving glow plug status information.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Continuously if not inhibited by LIN BUS Off failure
		[Fault Detection] • Timeout of Receive Frame GCU_DIAG (0x1D) is detected (glow plug diagnostic information)
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• Time out no more detected
System reaction		• None
Failure cause		• LIN Disturbance, glowplug connection interruption, defective glow plug
Failure repair		• Check LIN connection, check glow plugs
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

https://truckmanualshub.com/

520388-9: Control unit GCU4 has LIN timeout error while receiving glow plug current information and status information.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • Continuously if not inhibited by LIN BUS Off failure
		[Fault Detection] • All receive frames selected via 3.00- timed out: Messages GLP_CURB1 and GCU_DIAG timed out
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• At least one receive frame received
System reaction		• None except FIDs
		• 1) FId / Funktionsidentifier for Receive Frame GLP_CURB1 (x18) • 2) FId / Funktionsidentifier for Receive Frame GCU_DIAG (x1D)
Failure cause		• LIN Disturbance, glowplug connection interruption, defective glow plug
Failure repair		• Check LIN connection, check glow plugs
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520391-0: Component ‘Glow Plugs’ has detected an overvoltage.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If Over voltage error is reported by LIN (Com_stOvrVltg = 1).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• If Over voltage error is not reported
System reaction		• None
Failure cause		• Overvoltage at main power supply / GCU4
Failure repair		• Check GCU4 voltage at connector term.30 with running engine, if overvoltage is not present, failure can be deleted. Failure was probably caused by jump start (24V). • If voltage is abnormal, problem at alternator control. • Check alternator.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520391-9: Engine control unit has LIN timeout error while receiving informations from control unit GCU4.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If GlwPlg_stGCUComActv is true (LIN communication active) and no new frames received from GCU4
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• If frame is received from GCU4
System reaction		• None except FIDs
		• 1) Fid / Inhibit glowplug monitor
Failure cause		• LIN communication problem or glow plug failure
Failure repair		• Check LIN, check glow plugs
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10

Inspection procedure	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520391-12: Component ‘Glow plug’ is thermally overloaded.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
	[Fault Detection] • When over temperature is reported by LIN.(Com_stOvrTemp=1)
	[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing	• When over temperature is not reported by LIN.(Com_stOvrTemp=1)
System reaction	• Glow Plug switched OFF • Further reactions see FIDs
	• 1) Fid / Inhibit glowplug monitor
Failure cause	• High battery voltage, high temperature inside Glow Plug Control, high load or wiring problem
Failure repair	• Check battery load and output, check wiring, replace Glow Plug Control

https://truckmanualshub.com/

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9

https://truckmanualshub.com/

Inspection procedure	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520391-31: The Glow Plugs Control Unit could not be reset.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • When GlwPlg_stMch = CD535_RST_CMD and GlwPlg_stPRFlg = 0 i.e. GCU4 not responding for request to reset. • OR when GlwPlg_stMch = GE_CLR_CMD and GlwPlg_stPRFlg = 1 i.e. GCU4 not responding for request to set the GE flag.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Command from ECU to GCU and status replied by GCU are compatible
System reaction		• None
Failure cause		• GCU not responding to set/reset command from ECU
Failure repair		• Internal GCU4 SW failure code, no direct check possible • Replace GCU4.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520392-1: Component ‘Fuel pump’ has detected an undervoltage.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • When there is charge pump under voltage reported by LIN (Com_stCPUV=1).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Undervoltage no more detected
System reaction		• Glow Plug switched OFF • Further reactions see FIDs
		• 1) Fid / Inhibit glowplug monitor
Failure cause		• Glow plug failure
Failure repair		• Replace glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520393-5: Component Y11 (Glow plug 1) has an Open Load error.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current on cylinder 1 Com_uGlpCurrA < 0.23V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current on cylinder 1 Com_uGlpCurrA > 0.23V
System reaction		• None except FIDs
		• 1) Fid / Glow control monitor deactivated
Failure cause		• Open load error in the glow plug of cylinder 1
Failure repair		• Check glow plug and wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10

https://truckmanualshub.com/

Inspection procedure	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520393-6: The electric circuit of component ‘Y11 (Glow plug 1)’ is overloaded.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
	[Fault Detection] • If the plug current Com_uGlpCurrA > 2.20V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing	• Plug current Com_uGlpCurrA < 2.20V
System reaction	• Glow plug for cylinder 1 is deactivated. • Further reactions according to FIDs
	• 1) Fid / Glow control monitor deactivated
Failure cause	• Current overload for Glow Plug of cylinder 1

https://truckmanualshub.com/

Failure repair		• Check glow plug cylinder 1 • Check wiring between glow plug cylinder 1 and GCU4 • After repair, system can be checked using actuator test: • Activate Glow plugs by sending duty cycle > 8% for at least 5 seconds at PWM Outputs: Glow Plug Actuator (Id: $D90C). • After that verify Failure memory to check if failure was detected again. • If not, problem is solved.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to Step8

https://truckmanualshub.com/

Inspection procedure	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520393-31: Glow Plug control unit 4 has a Transistor failure for glow plug in cylinder 1.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • Glow plug of cylinder 1 reports over LIN a MOSFET error (Transistor failure)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Glow plug of cylinder 1 does not report a MOSFET error (Transistor failure)
System reaction		• Glow plug for cylinder 1 is deactivated. • Further reactions according to FIDs
		• 1) Fid / Glow control monitor deactivated
Failure cause		• Glow plug failure of cylinder 1
Failure repair		• Replace glow plug for cylinder 1
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

https://truckmanualshub.com/

520394-5: Component Y13 (Glow plug 3) has an Open Load error.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current on cylinder 3 Com_uGlpCurrA < 0.23V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current on cylinder 3 Com_uGlpCurrA > 0.23V
System reaction		• None except FIDs
		• 1) Fid / Glow control monitor deactivated
Failure cause		• Open load error in the glow plug of cylinder 3
Failure repair		• Check glow plug and wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520394-6: The electric circuit of component ‘Y13 (Glow plug 3)’ is overloaded.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current Com_uGlpCurrA > 2.20V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current Com_uGlpCurrA < 2.20V
System reaction		• Glow plug for cylinder 3 is deactivated. • Further reactions according to FIDs
		• 1) Fid / Glow control monitor deactivated
Failure cause		• Current overload for Glow Plug of cylinder 3
Failure repair		• Check glow plug cylinder 3 • Check wiring between glow plug cylinder 3 and GCU4 • After repair, system can be checked using actuator test: • Activate Glow plugs by sending duty cycle > 8% for at least 5 seconds at PWM Outputs: Glow Plug Actuator (Id: $D90C). • After that verify Failure memory to check if failure was detected again. • If not, problem is solved.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

https://truckmanualshub.com/

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6

https://truckmanualshub.com/

Inspection procedure	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520396-5: Component Y12 (Glow plug 2) has an Open Load error.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current on cylinder 2 Com_uGlpCurrA < 0.23V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current on cylinder 2 Com_uGlpCurrA > 0.23V
System reaction		• None except FIDs
		• 1) Fid / Glow control monitor deactivated
Failure cause		• Open load error in the glow plug of cylinder 2
Failure repair		• Check glow plug and wiring
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

https://truckmanualshub.com/

520396-6: The electric circuit of component 'Y12 (Glow plug 2)' is overloaded.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current Com_uGlpCurrA > 2.20V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current Com_uGlpCurrA < 2.20V
System reaction		• Glow plug for cylinder 2 is deactivated. • Further reactions according to FIDs
		• 1) Fid / Glow control monitor deactivated
Failure cause		• Current overload for Glow Plug of cylinder 2
Failure repair		• Check glow plug cylinder 2 • Check wiring between glow plug cylinder 2 and GCU4 • After repair, system can be checked using actuator test: • Activate Glow plugs by sending duty cycle > 8% for at least 5 seconds at PWM Outputs: Glow Plug Actuator (Id: $D90C). • After that verify Failure memory to check if failure was detected again. • If not, problem is solved.
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control "Cold start". Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5

https://truckmanualshub.com/

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520396-31: Glow Plug control unit 4 has a Transistor failure for glow plug in cylinder 2.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • Glow plug of cylinder 2 reports over LIN a MOSFET error (Transistor failure)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Glow plug of cylinder 2 does not report a MOSFET error (Transistor failure)
System reaction		• Glow plug for cylinder 2 is deactivated. • Further reactions according to FIDs
		• 1) Fid / Glow control monitor deactivated
Failure cause		• Glow plug failure of cylinder 2
Failure repair		• Replace glow plug for cylinder 2
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to step3

https://truckmanualshub.com/

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Inspection completed
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520397-31: Component 'Y11 (Glow plug 1)' has a short circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active)
		[Fault Detection] • If a Short circuit error is reported for a glow plug over LIN. (Com_stGlpStat=03 and Com_stErrGlpX>0, both in GCU_DIAG message).
		[Defect Debouncing] • Immediate
Fault healing		• No short circuit reported
System reaction		• Glow plug for cylinder 1 is deactivated. • Further reactions according to FIDs
		• 1) Fid / Glow control monitor deactivated
Failure cause		• Short circuit in glow plug of cylinder 1 or in its wiring
Failure repair		• Check wiring, check and replace glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control "Cold start". Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5

https://truckmanualshub.com/

520401-31: The power supply of circuit 30 is not OK.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • When there is no voltage present at the Terminal 30, reported over LIN (Com_uT30Vltg1=0x00) or • (Com_uT30Vltg2=0x00 in message GCU_DIAG)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Missing voltage not reported
System reaction		• Glow Plug switched OFF • Further reactions see FIDs
		• 1) Fid / Inhibit glowplug monitor
Failure cause		• No supply on T30, GCU4 detects no terminal 30 voltage
Failure repair		• Measure GCU4 voltage at connector term.30 • If voltage is not present or very low failure can be result of disconnected T30 supply wire. Check wire and connection (slackly screw at battery)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of A31 (Preglow system Control unit). Remove the connector of Y11 (Glow plug 1). Remove the connector of Y12 (Glow plug 2). Remove the connector of Y13 (Glow plug 3). Remove the connector of Y14 (Glow plug 4). Remove the connector of HF5. Remove the connector of A20 (SAM). Remove the connector of Ground. Check the circuit across A4.X2.94/44 and A31.11/10 for open or short circuit. Check the circuit across A31.11/1 and Y11.1/1 for open or short circuit. Check the circuit across A31.11/2 and Y12.1/1 for open or short circuit. Check the circuit across A31.11/3 and Y13.1/1 for open or short circuit. Check the circuit across A31.11/4 and Y14.1/1 for open or short circuit. Check the circuit across A31.11/11 and HF5 for open or short circuit. Check the circuit across A31.11/6 and A20.X10.14/2 for open or short circuit. Check the circuit across A31.11/7 and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Inspection procedure Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Replace component “A31 (Preglow system Control unit)”. Reinstall all the removed connectors. Go to Step8
	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step6
	Step10	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520418-0: Signal Range Check (SRC) for ‘voltage of the piezo fuel injector actuator’ reports HIGH.

Generation condition	[Test Condition] • Continuously speed synchronously with each measurement of a main injection.
	[Fault Detection] • If the raw actuator voltage of Piezo Injector > 3.30V
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing	• If the raw actuator voltage of Piezo Injector < 3.30V
System reaction	• Only according FID (see FID’s)
	• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 3) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 4) FId / Misfire Detection disabled • 5) FId / Inhibit OxiCat passive monitor • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause	• Failure in wiring harness between ECU and injectors • Failure in injector (actuator) • Failure in ECU (power stage)
Failure repair	• Check wiring harness between ECU and injectors • Check injectors • Check/Replace ECU

https://truckmanualshub.com/

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of Y15 (Fuel injector 1). Remove the connector of Y16 (Fuel injector 2). Remove the connector of Y17 (Fuel injector 3). Remove the connector of Y18 (Fuel injector 4). Check the circuit across Y15.2/1 and A4.X1.60/31 for open or short circuit. Check the circuit across Y15.2/2 and A4.X1.60/46 for open or short circuit. Check the circuit across Y16.2/1 and A4.X1.60/17 for open or short circuit. Check the circuit across Y16.2/2 and A4.X1.60/2 for open or short circuit. Check the circuit across Y17.2/1 and A4.X1.60/16 for open or short circuit. Check the circuit across Y17.2/2 and A4.X1.60/1 for open or short circuit. Check the circuit across Y18.2/1 and A4.X1.60/32 for open or short circuit. Check the circuit across Y18.2/2 and A4.X1.60/47 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which A4 (Combustion engine Control unit) learns. Perform coding of Fuel injector which A4 (Combustion engine Control unit) learns. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step5
	Step5	Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

520418-1: Signal Range Check (SRC) for ‘voltage of the piezo fuel injector actuator’ reports LOW.

Generation condition	[Test Condition] • Continuously speed synchronously with each measurement of a main injection.
	[Fault Detection] • If the raw actuator voltage IVActr_uActrRaw_mp or IVActr_uImmdMeasRaw_mp falls below the limiting value 0.00mV, an error will be detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing	• If the raw actuator voltage of Piezo injectors > 0.00mV

https://truckmanualshub.com/

System reaction		• Only according FID (see FID's)
		• 1) Fid / Reagent dosing quantity for SCR reduced (to DStgy_facUreaDesRed_C) • 2) FId / Adaptation of the correction values of Fuel Mass Observer (FMO) inhibited (no correction of detected deviation between injected fuel and Lambda sensor signal) • 3) FId / Fuel Mass Observer (FMO) switched off (no monitoring of injected fuel by Lambda sensor) • 4) FId / Misfire Detection disabled • 5) FId / Inhibit OxiCat passive monitor • 6) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Failure in wiring harness between ECU and injectors • Failure in injector (actuator) • Failure in ECU (power stage)
Failure repair		• Check wiring harness between ECU and injectors • Check injectors • Check/Replace ECU

520419-2: Injector Adjustment: IMA/ISA programming not correct for cyl 1.

Generation condition		[Test Condition] • After each switch on of the ECU (Key 15 “on”)
		[Fault Detection] • The checksum is not correct • OR • one correction class is not within 1.00- and 6.00- • OR • the EEPROM displays a value of 0 (not IMA/ISA programming not done)
		[Defect Debouncing] • immediate
Fault healing		• No healing at actual driving cycle. • Healing possible if all values correct at next system start or after a reprogramming of the injector correction.
System reaction		• The dedicated injector is not corrected, i.e. the fuel quantity of this injector could deviate more than usual. Possibly irregular engine idle • Further reactions according FID (see FID’s)
		• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)
Failure cause		• Invalid IMA/ISA code has been programmed • wrong programming/flashing of the EDC (initialization of EEPROM) • internal defect of the ECU
Failure repair		• Reprogram IMA/ISA code • Reflash the ECU (including EEPROM initialisation) • if defect persists: replace EDC
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520419-31: Injector Adjustment: IMA programming not correct for injector cyl 1.

Generation condition		[Test Condition] • After each switch on of the ECU (Key 15 “on”) • After each programming with tester.
		[Fault Detection] • the checksum of the injector adjustment code words is not correct • OR • the basic correction quantity of at least 1 correction class not within the acceptable range for this class • OR • no injector adjustment values could be read due to faulty EEPROM access.
		[Defect Debouncing] • immediate
Fault healing		• No healing at actual driving cycle. • Healing possible if all values correct at next system start or after a reprogramming of the injector correction.
System reaction		• The dedicated injector is not corrected, i.e. the fuel quantity of this injector could deviate more than usual. Possibly irregular engine idle • Further reactions according FID (see FID’s)
		• 1) Fid / SCR Monitoring or DEF injection release not possible (according calibration of Release Masks)

Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520423-16: Signal Range Check (SRC) for 'Accelerator pedal position during Low Idle Accelerator pedal position Adjustment' reports HIGH.

Generation condition		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The sensed raw voltage value LIAdj_uAPPRaw is above 4.50V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• The sensed raw voltage value LIAdj_uAPPRaw is less than 4.50V
System reaction		• Low idle accelerator pedal adjustment value jumps to fixed replacement value 0.00%
Failure cause		• Short circuit to external source or defective sensor
Failure repair		• Check wiring and sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with A20 (SAM) is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A4 (Combustion engine Control unit). Remove the connector of B17 (Position sensor Accelerator pedal). Check the circuit across A4.X2.94/30 and B17.6/5 for open or short circuit. Check the circuit across A4.X2.94/57 and B17.6/4 for open or short circuit. Check the circuit across A4.X2.94/45 and B17.6/6 for open or short circuit. Check the circuit across A4.X2.94/8 and B17.6/2 for open or short circuit. Check the circuit across A4.X2.94/35 and B17.6/1 for open or short circuit. Check the circuit across A4.X2.94/46 and B17.6/3 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Inspection procedure Turn the starter switch in OFF. Replace component "B17 (Position sensor Accelerator pedal)". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5

Inspection procedure	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Inspection procedure Perform the operation start and replace A4 (Combustion engine Control unit). Go to Step7
	Step7	Inspection completed
